I have a video adapter for the Mega ST to an NEC Multisync,
and I want to use it with a Sony Multisync, which has a 9-pin
non standard VGA pin layout. Unfortunately I don't know the
pin assignments of the NEC (which is also 9-pin).
Is it standard VGA? Who can help?

Thanks in advance.

DBman - last atari version 5.3 was still available through toad up untill
a year ago. It is completely file and program compatible with dbase III
and has some of the dbase IV functions as well. I have been using it as a
database program since 1986. It is much better than any of the other
available alternatives. (although I would reccommend using version 5.2 as
it appears to work better than 5.3 on an ST. According to versasoft, the
5.3 version was compiled on a TT to use the 68030. BTW we tested the
same dbase program on a 8 MHz ST, a 12 MHZ 286, a 16 MHz 386, a 33 MHz 486
and 32 MHz TT.The program was run on dbase III on the PC and dbman on the pcs with the
same data files. The results were something like:

ST - 1min 26 second
286 - 4 min 18 seconds
386 - 1 min 18 seconds
486 - 22 seconds
TT - 8 seconds

Remember thius was exactly the same program and data files so there was no
difference in approach. I never bad mouthed the speed of my ST again.

BTW I wouldn't compare these times to the same program running on FOX it
is 4 - 8 times as fast as dbase.

If you are looking for a program that will import dbase files, try atari
works. It unfortunately doesn't have the same relational capapilities.

4. Re: Power Without the Price, No more (Re: Toad Christmas SPECIALS -- through 12/23/96!!)

Toad is about the ONLY company tha still regards Atari computers as real computers. Most of you guys still think of Atari as nothing more than a game platform and sell them as a simple game server. Its the users of Atari computers who have driven the prices down in private sales. A guy buys a 1040 for $700 and a few years later nobody will pay more than $50 for it. C'mon now folks, the hardware is much better than that. These are REAL computers, not nintendos.

Toad recognizes this fact and sells their stuff as real computers. They also stand behind their sales if something goes wrong. Toad currently sells a 1 meg 1040 for $199 and thats a very good and realistic price, but if a guy advertised one here for sale as an owner looking to sell his stuff, most of you would say thats too much for a 1040. SO admit it folks, either you have real computers or nintendos for sale in this group. I say that Atari made real computers and I bought them as such and will sell them as such when the time comes.

5. Help: Broken Falcon Serial Port

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-02 00:00:00 UTC
From: scotty@toolies.com
Message-ID: <slrn5cm270.ig.scotty@toolies.com>
Source record: 18536

Hi Folks,

I haven't used a modem on my Falcon in over a year. Today I finally got a phone jack installed, only to find that the Falcon's serial port won't work! I can send text to the modem, but nothing comes back. No "OK" or anything else. I can even dial out with the modem and connect, but nothing ever comes the other way.

I swapped out the cable and the modem, and nothing changed. It appears that the RXD pin, or whatever it's connected to no longer works.

Is anyone familiar enough with the Falcon to suggest a fix? I've considered taking the machine apart to look for a broken solder connection. I've also wondered if a different port -- such as the localbus or midi port, can be used with a modem instead. I've noticed that Connect lists the midi port as being selectable for a serial port.

Thanks for any help.

Source record: 18538

I have a 40meg external mac HD, and would like to connect to my 1040. Is there a standard cable that would work? What would be the best driver/editor software to start 'er up once I get a cable?
Also, I'm looking for the best way to download software from my mac, and transfer it to the ST. I've had some success after unzipping, and saving to a 800K DOS disk, but looking for a more reliable system.
I've hooked the ST to my mac with a null modem cable before, and it transfered ascii just fine. would this be a better solution for transfer?

Thanks in advance,
Mark

I did this modification myself a couple of year ago. I will recommend you
to solder sockets in the spare RAM slots on the motherboard, and not solder
the RAM directly on the board. As far as I remember, you will also have to
solder two resistors to enable the extra RAM. Look for spare resistor
slots!

9. Eureka a graph describer and 3D modeler

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-02 00:00:00 UTC
From: lecoat@tokay.ief-paris-sud.fr
Message-ID: <5ag53h$rml@upsn6.u-psud.fr>
Source record: 18540
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.programmer

Hello everybody,

I'm a french developper working on a program called Eureka 2.12.
It's a 2D numerical analysis program, and a 3D modelling of
mathematical shapes. It also includes 4D presentation, because
a time parameter is available. It's quite easy to make movies
showing the evolution of a formula in 3D rotating, morphing from
a shape to another etc... Data files can be loaded so that you can
manipulate series, or even stereo/mono sample files manipulating
sounds. Images can be produced, computing them with formulas to
draw fractals such as Julia or Madelbrot sets. You can even map
these images on a 3D surface, producing impressive representations.
Since recent revision of my program it is now in two languages
French and English. The english translation of the documentation
will be soon available. My goal is to make a program like some
on other platform such as Mathematica or Matlab. It has been
tested with success on MAGIC, TOS2WIN and STonX.
My work is a complete package including the program and some
accessory like a snapshot, an unusual recording accessory that
allow you to demonstrate the program like a mecanical piano would
play Stravinsky (?). There's a program that can show your movies
etc ...
The latest english version is available on my home page at :
http://www.ief.u-psud.fr/~lecoat/
That page is mainly illustrated with my program so that you can
see what is possible to do. Eureka has 3D2 Raw and VRML exports
so you will see Virtual reality demonstrations of objects, and
movies or images produced with Persistence Of Vision.
The latest revision will also be available soon by FTP on the
"Conservatoire National des Arts et Metiers" at :
ftp://ftp.cnam.fr/pub/Atari/Applications
Anyway for any problem report in my mailbox at :
lecoat@ief.u-psud.fr
Any suggestions are also welcomed ...
Have fun with my production, bye for now ...

Nothing. You only need to change the four original SIMMS. The Operative System checks the configuration at boot-up. I made that upgrade several years ago. It's really easy!.

If you have ICD software:
Scsi ID 8 is ICD idea: ICD give number 0 - 7 to ACSI, 8 - 15 to SCSI
and 16 to IDE(falcon). In fact all number are in 0-7 area with
different hardwares.

>I was installing the Spectre GCR today and the CGR needs SCSI ID 1 to 7....
>
Sorry but spectre GCR 3.0 doesn't work with SCSI port(of TT), only
with ACSI (Megafile, scsi drives with dma/scsi interface, ...)
The SCSI ID is given by the hard disk, not the mother board.

Thierry

Forget it. MiNTnet and Linux use different ways to communicate via the
parallel port. The reason is simple : The PC parallel port supports a lot
more lines than the ST version. Thus there was no way for Kay to make it
compatible.

Cheers Peter

Do not confuse a Mega ST with a Mega STE. The Mega ST has no SIMM slots.

Cheers Peter

Again, do not confuse the Mega ST with a Mega STE. The Mega ST has no DIP switches. If you got some you must have got a Mega STE.

The Bios stores the DIP settings in the _SWI cookie. I'm not sure about their meaning either. I know that one tells the desktop to show a HD option in the disk formatting dialog.

I've put the Quantum Lightning 730 into my Mega STE. Works lovely, is
about a factor of ten faster than the ST 157 N (at least it appears so) !
With programs you earlier had the impression the HD works more than the
CPU then with the Lightning it's the other way round.

Can't remember, you probably need to change a jumper to switch off parity.

> Can I use the `MEGA STE Advanced HD Utilities` to format
> any SCSI HD or just Seagate ST157N?

I'd guess the thing should do it. I usually use Claus Brods sector editor
"SED", which has a very good hard drive part.

Cheers Peter

This is not quite right. There is a german hardware manufacturer that
almost finished development of an SCSI - Ethernet adapter. He also sells
ACSI - SCSI adapter. I've been told that the former does comprise the
latter, but I'm not sure.

Many people operate it this way !

It's also only true for now that Ethernet cannot be used with STiK. There
is work going on to include other interfaces (Ethernet too) into STiK.

Cheers Peter

With Linux it is different, as Linux is capable of IP masquerading,
something MiNTnet is not up to yet.

> I suspect that by assigning a non-existant IP address to your PC and the

Please do not do such things, it will always cause trouble to use
non-existant, non-reserved IP addresses. One day they will be used, and a
real mess will happen.

Cheers Peter

Are you sure you didn't mix it up with the ROM ? I'd expect two ROM
chips, and four empty slots, as in earlier times the machines were made
with six chips. And of course they are marked Atari, as they contain the
proprietary TOS operating system.

A Mega ST 2 should have 16 1-Mbit-chips. There is nothing like a 512k
dynamic RAM chip, no desktop computer uses static RAM for the main memory.
Check if you have 16 other places, probably next to the first ones, where
you could solder in 16 more of those 1 Mbit chips (18 pins each). Go for
any dynamic 1 Mbit RAM, all chips these days are fast enough.

Cheers Peter

How many Megs can you use with the Atari Mega STE? If you put in 2
4x1MB SIMMS will it use 8 megs?

Did you disable synchroneous data transfers? You have to. There is a
jumper for this on most IBM drives.

You also have to install a cap across each chip/socket. And some Mega 2's will
not take the extra RAM on the motherboard. It's probably better to install an
XTRA RAM with 2 1 meg SIMMs, it should only cost about $60 US. 2 or 3 years ago,
the DRAMs cost me about $80, IIRC.

Dan

No, Toad is not the ONLY company. Computer Direct is pretty well
exclusively devoted to TOS and MagiC platforms. Toad is hyping their PCs
(with Gemulator built in) and their Internet service provider business.
They still sell Atari stuff, and provide support, but appear to be
winding down their involvement in the world of TOS computing. Computer
Direct, on the other hand, will only sell you a Mac or Mac Clone if you
REALLY insist, and steadfastly refuse to have anything whatsoever to do
with PCs. Check them out at http://compdirect.com. They are doing some
really amazing stuff.

Bill Merik
VERY satisfied Computer Direct customer and beta tester.

Actually, you are exactly right. I just got excited when I saw four empty places to pop in some chips and figured, "hey, easy upgrade!" No such luck, though, as I now seemed destined to break out the soldering iron.

My trusty STe w/4megs is no longer trusty. It keeps having
this problem where the mouse and kybd conk out for no apparent
reason. This USUALLY but not always follows the power indicator LED
briefly going out unless i 'tap' the chassis...then the LED comes
back on...but everything is still dead. I opened it and thought i
had the problem licked ...but it continues.

I tried analyzing my system with the program 'PROFILE' ...it
indicates now and again that the cpu speed is only 7 instead of 8 Mhz
...but it waffles back and forth sometime between 7 and 8 ...is THIS
the real problem? is the cpu just too old now??

PLEASE respond email

any and all help appreciated,

Hye!

My falcon wont recognise a Quantum 1.2 Gig which I installed. As disk
0. The only drive apart from a 850Mb eide inside.
Whatever I do, AHDI 6.06 won't see it during boot up. ICD tools will,
but Cubase wont deal with it.
'Non AHDI-compatible scsi driver' or something to that end.
The drive however is formatted, partitioned and all (by ICD tools).

Anyone can help?

>you have real computers or nintendos for sale in this group. I say that
>Atari made real computers and I bought them as such and will sell them as
>such when the time comes.

I need to correct you in that you may TRY to sell your Atari for any price you wish to ask for, but finding a sucker to pay it is another matter altogether. I can go to local electronic discount resellers(USED) and find 1040ST computers stacked in bins for $30 to $50 each depending on condition. If you purchased your computer thinking it would hold its value like a fine collectable, you are VERY mistaken. Computers lose their value almost as fast as the ice-cream cone you purchase from a street-side vendor on a HOT summer day. If I constantly thought about what I have paid for hardware and what its worth now. I would NEVER buy another computer again...

I have heard rumors of the Falcon Speed being upgraded but they are unconfirmed. Since the 286 is surface mounted you can't use a regular upgrade chip since they need sockets. Now, it might be possible to remove the 286 and solder in a socket and go from there. You might need a socketed 286 on which to piggy back the upgrade, depeding on the upgrade board itself. Compo always said it couldn't be done, but of course, they wanted to sell the 486 board when it was released -- sadly never. If there was one I'd have it in my machine at this moment!

If you're brave, or have an electronics friend, get hold of an upgrade board and see what connections it needs to your 286. Then have your friend look and see if it's possible. My feeling is that it's probably workable.

Anyone out there actually _know_ of a successful upgrade?

I know there is an intreface to let you hook up IDE CD Rom drives, but don't know if it would work for hard drives. Probably not, though, since the CD Rom driver wouldn't have to support writing, just reading. Try contacting System Solutions in the UK.

39. Mega ST DMA pinout needed

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-05 00:00:00 UTC
From: Mike Wasinger <mwasinge@nyx.cs.du.edu>
Message-ID: <32D07BE4.1C53@nyx.cs.du.edu>
Source record: 18570

I am trying to connect an ICD host adaptor meant for a Mega-ST
to the DMA port on my 1040 ST. Does anyone know the pinout for
the 22 (or is it 24) pin DMA connector inside the Mega ST? If
I can map these 22 pins to my DB-19 I should be all set.

Any help would be great. Please also reply via email if you have
any info.

Thanks,
Mike

40. Re: Adding RAM to MegaST

>>> couple of megs of RAM to the motherboard. There are four open RAM
>>> slots, so I assume that the board is expecting 512k RAM chips;

>> Are you sure you didn't mix it up with the ROM ? I'd expect two ROM

b> Actually, you are exactly right. I just got excited when I saw four
b> empty places to pop in some chips and figured, "hey, easy upgrade!" No
b> such luck, though, as I now seemed destined to break out the soldering
b> iron.

The Marpet "Xtra RAM deluxe" plugs into/over the MMU chip and under the video shifter chip and ribbon cables connect those adaptors to a board where you can plug 4*1MB SIMMs boards.

The original memory is disabled by lifting the ends of some resistors and connecting them to 5V using the clips provided in the kit.

Not quite plug'n'play but quite easy to do.

Regards, Derryck

41. Wanted: DMA chip for STe

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-06 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <32d03d42b2cc11@sn.no>
Source record: 18572

Has anyone good one of the "good" DMA chips that fit the STe for sale?
My dad has one of the machines with the faulty ones in it and he's about to
get a harddisk for it.
As I understand that the faulty DMA chips corrupt the harddisk I told him
that he'll need a new one before he gets the harddisk.

The "good" DMA chips are marked: C398739-001A

(the faulty one which he has is marked: C025913-38)

Hi,

Try formatting your drive with the AHDI Compatibility option in ICD
Software turned on.

This should solve the problem.

All the best,

What are you talking about ? A DMA connector with 22 or 24 pins inside the Mega ST ? You can connect the ICD host adapter to the DMA 19 pin connector at the rear of the machine. AFAIK inside you'll only find the Mega Bus which is a processor bus slot, basically, not at all compatible with DMA.

Cheers Peter

46. ST + Zip drive?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-06 00:00:00 UTC
From: Ben Hall <cb170@city.ac.uk>
Message-ID: <Pine.GSO.3.95.970106190537.14663A-100000@swindon>
Source record: 18577

Does anyone know how easy it is to add a ZIP drive to my ST system?

I am currently running a MiniS hard drive via the ICD Link2 SCSI adapter, with the ICD driver software. I'm hoping it's as simple as adding a SCSI cable from the extra SCSI port on my HD, and connecting it to the ZIP, setting the SCSI id and adding the extra drive setup with the ICD software.

Will this work? Would I need additional software to support the ZIP, or will the ICD driver software cope with it together with my current drive?

Any one have ST experience with ZIP drives? It seems a nice way to do backups and the like, and as they are currently pretty cheap I am tempted...

Thanks,

I can't help with your problem, but many hackers use sector and bit
editors to recover data. Who knows why it happened. Sh*t happens.
Sorry. I do know that chances of recovering data from the partition
with Diamond Edge are nill if you first didn't have the application
installed and performed the master directory backup before the crash.
Besure to do a "disk surface scan" after you recover the remaining
files to another disk. Run it a couple of times to be sure you have
any bad sectors mapped out for the driver to look up. If the number
of bad sectors changes each time you do the check, your probably
flaking off some magnetic particles and it might be time to replace
the disk or suffer the problem again.

The parallel port is bi-directional, the problem is that it is missing
several of the non-essential handshake lines (things like paper out)
which are used by a lot of parallel port stuff like ethernet cards.
You can bodge a DLINK600 parallel port adaptor into the cartridge
port - MiNTnet comes with a driver for it....

As of late, my Falcon has developed an odd little problem. When I turn it on, it boots up fine but whenever I try to warm-boot the machine, either by keyboard or the reset button, the screen turns black and never boots up. I have to physically turn it off and back on again before it will come up again.

Is this a sign that a more serious problem is developing? Power supply maybe?

Thanks for any insight.

-Jared

I think so. Use a 25 Pin D-Sub to 50 Pin SCSI Kable to connect
the ZIP after your HD. (I think that was the right kable)
Remove termination from your hd, set terminator on your ZIP.
! Make sure befor buying the ZIP your ICD Links generate PARITY !

Without parity your ZIP don't work!
HDDriver 6.x for nice ZIP handling..

Good Luck :)

regards, Robert
(Allways the same ZIP on : F030/ST/Mac)

You shouldn't try to write to the drive at all as long as your problems
are not solved. Sounds like there is something wrong with your hardware.

I don't think so because this sounds like a problems that is not at all
related to the software you use. Nevertheless you might want to try it
with the current demo version of HDDRIVER. You can get if by anonymous
ftp from acp5.chemie.uni-kl.de/pub/atari or
http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html

Maybe Cubase doesn't support initiator identification. If this is the
case and you have a Quantum Fireball and Cubase comes with its own SCSI
routines (i. e. with routines not supporting initiator identification),
you won't be able to use this drive with Cubase.

greg_evans@delphi.com wrote:

> What size are your partitions? AHDI does not support as big a size
> as ICD.

This is wrong. These are the maximum partition size AHDI supports. Not
the driver but the TOS version is important:

TOS < 1.04: 256 MBytes per partition
TOS < 4.0: 512 MByte per partition
TOS 4.0 or MagiC or any TOS version with Big-DOS: 1 GByte per partition

TOS 4.0 even seems to support up to 2 GByte per partition but this
partition size is outside the GEMDOS limits.

An any case, AHDI supports each of the partition sizes mentioned above.

Any hard disk driver that supports removable media (e. g. Syquest) will
do for the ZIP because the ZIP is nothing more that a standard drive for
removable media.
In case you want to make use of the password based read/write protection
of the ZIP drives you might want to take a look at HDDRIVER which comes
with special ZIP support.

> 4x1MB SIMMS will it use 8 megs?

Without additional hardware boards (like accelerators and things like
that), the maximum memory possible in an ST/Mega ST/STE/Mega STE is
FOUR Megabytes. Using SIMMS you *always* need to install the modules
two by two. The greatest SIMM module you can use is 1Mbyte. You can
install greater modules, but the extra capacity won't be used.

If you have any other question send me a copy of the message to my addr
since when I am busy (most of the time) I tend to skip threads.

There is another jumper which has to be set with this disk. I don't remember
which one, it had something to do with "target initiated negotiation" or
something. This has to be disabled also for Atari computers.

I have to look it up at home in my data sheet.

Greetings,
Thomas

For Sale:

Catch computers (Systems Solutions) high spec TT ram expansion board
(takes upto eight simms) fitted with 16MB fastram (four 4MB 30-pins). The
fastest fastram upgrade available for the TT. Can take upto 128MB!

Cost over ï¿½600 but will sell for ï¿½300 o.n.o.

If interested,

Dr Simon Williams
email spesgw@cf.ac.uk

Yup I have heard about it. It looks to be rather nice as well as the SCSI
port is uing DMA. Fast and doesn't take any CPU power at all. :-)

Well it looks like he will set up a rooter in the basement. I have no idea
how this stuff work, but I guess it wont cause any problems for me, or?

BTW. It isn't decided that he will install it. It does depend on how many
are interrested but hopfully he will do it, if I can use it that is. :-)

It's rather cool I must say. Just plug your computer into a socket in the
wall. No need to block the phone or pay expensive phonecalls. :-))

> It's also only true for now that Ethernet cannot be used with STiK. There
> is work going on to include other interfaces (Ethernet too) into STiK.

Well I doesn't realy care about STiK. MiNT will do. I wold like to get
it running under MagiC thought and then I can't use MiNT-Net or I just
have to sit down and make a decent MiNT installaion. There are many
other nice things with MiNT too. :-)

The ICD host I referred to is not an external "Link" unit or any other
generic ICD ST host. It is a MegaST specific unit.

I have an ICD host adapter which was designed to be an INTERNAL host
inside a MegaST. It does not connect to the back of any machine as it
has a dual row of 0.1" spaced pins meant for a cable that would plug
into what must be the internal DMA port on the MegaST.

I would like to use this adapter inside a hacked 1040 ST with a small
2.5" SCSI disk sitting in the empty area between the P/S and the FD.
In order to do this I need to know the pin labels for the internal
MegaST DMA bus/port so that I can connect them correctly to the 19 pin
DMA port.

If anyone has a schematic of the MegaST mb I could really use the info.

Thanks,
Mike

67. TwentyFour & GCR to sell

Newsgroup: comp.sys.atari.st.tech

I have three things to sell:

- one Steinberg TwentyFour official & complete with english manual.
- one Spectre GCR in a very good condition with system 6.4.
- one Ibanez DM 1000 Digital Delay in perfect condition.

I will not ask too much for these two items I don't use no more.
Feel free to make any proposition.

Source record: 18450

Take five minutes to read this and it WILL change your life.

I've been a fool so far. Yes, I admit it I've been a fool. I've
been doing this on local BBS's for the last 2 years. I've been
getting about 40 to $50,000 a year if that. I tried it the net
3 weeks ago and I wouldn't believe it! Not just a little each week
(barely enough to keep my head above the debt), but tons, I mean
big bucks! In the first week I got three hundred dollars, then a
week later, a couple of thousand, and by the end of the third week,
I had recieved nearly $32,000.00.

It's REALLY SIMPLE to do too!!!

Here's all there is to do:

STEP 1.

Invest your $5 by writing your name and address on five seperate
pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING
LIST."
(In this way, you're not just sending a dollar to someone; you're
payingfor a legitimate service.) Fold a $1 bill inside each paper,
and mail them by standard U. S. Mail to the following five addresses:

1-Sam Coice
25550 Buckthorn Ridge Rd
Pioneer Ca 95666

2-Peg Vickmore
14905 Highway 88
Jackson, Ca 95642

3-Brian Hyson
4278 Sayoko Cr
San Jose, Ca, 95136-2335 USA

4-Daniel Hanlon Jr.
6001 Fox Run
Fairfax, Va 22030

5-Joe Munchak
13535 Union Village Cir
Clifton, Va 20124

STEP 2.

Now remove the top name from the list, and move the
other names up. This way, #5 becomes #4 and so on.

Put your name in as the fifth one on the list.

STEP 3.

Post the article to "at least" 250 newsgroups. Rembering that the more that you post on, the more people see it, and the more you will get. There are at least 30,000 newsgroups at any given moment in time so don't be stingy.

STEP 4.

You are now in business for yourself, and should start seeing returns within 7 to 14 days! Remember, the Internet is new and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back about 5 responses. Yes, thats right,only 5. You make $5.00 in cash, not checks or money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250 additional postings with your name at #4, 1000 postings. On average then, 50 people will send you $1.00 with your name at #4,....$50.00 in your pocket!

70. Wanted: DMA chip for STe

h>
h> The "good" DMA chips are marked: C398739-001A
h>
h> (the faulty one which he has is marked: C025913-38)

Confusingly, the chips fixed by Atari in the UK also had the same chip number. You need to check the serial number of the machine as well.

This is going on memory, but I think the doubtful range of machines had a serial number that started either A19 300... or A19 301... only these machines had the DMA whose tolerance was too wide to work reliably.

Also, no TOS 1.62 machines had the problem AIUI.

If you're intending to drive the machine above its normal spec (ie 16MHz accelerator) then you *will* need the C398739... chip.

There is indeed an internal DMA connector (near the back right, IIRC from my machine), in addition to the MegaBus slot. And one of the few uses it was put to was an internal ICD hard drive.

[Article crossposted from comp.sys.atari.st]
[Author was John Perez]
[Posted on 8 Jan 1997 10:36:52 GMT]

Greetings,

I am trying to use Kobold to transfer files to and from a 4gig
drive with 1gig partitions. I get an "Invalid Cluster Size" error. Can
Kobold not handle 32k clusters (if I understand this correctly)? Is there
any way to make this work other than GEMDOS mode?

Any idea what the largest partition size that I can use with
Kobold would be? 512meg?

Aloha,

that
>much or?

If I understand correctly, your complaint is that printing with GDOS takes longer than printing without GDOS. That's not a fault of GDOS (although NVDI is faster); using a GDOS printer driver means you are using the printer's bitmap graphics mode to print, rather than plain text. Assuming you use the same font size and a roughly equivalent font, you will be sending at least 64 times as much data to print the letter "W" with GDOS; if you have a 24-pin printer, you will be sending 576 times as much data. Even at parallel port speeds, sending this much data takes much longer.

Sounds pretty bad. Find someone with a PC and an Adaptec SCSI host adapter;
use the Adaptec to format the drive. If it's recoverable, the Adaptec SCSI
BIOS should be able to fix it.

Are you doing a warm-boot because of a crash? If so, I have experienced
this problem too, but not often. A warm reset does not do the same thing
that a "cold-boot" does and there might be a software problem that is
causing this. If you think about it, their are reset proof ram disks
that
work on the Falcon. Surely with a machine crash, a problem can remain
until the machine has been powered down and restarted.
Other than that I have not experienced any hardware related problem for
which you discribe. Try a warm reset from "normal" operations, like from
the desktop.

] *inside* a MegaST. It does not connect to the back of any machine as it
] has a dual row of 0.1" spaced pins meant for a cable that would plug
] into what must be the internal DMA port on the MegaST.

I'd guess this would be really the processor port, this is not a DMA
port !!! If it does DMA, then there must be a DMA controller on the ICD
board. If not, then the CPU will be busy transferring the data.

Anyway, a few docs exist which describe how to put a Mega ST processor
slot into the older machines. I know the german c't magazine once
published one.

No. a majority of the time it's not from a crash. It's just from
either desktop in a singleTOS environment or from MiNT. I haven't
attempted it from a totally clean system, but I haven't recently
installed any new ACC or AUTO programs.
Thanks.

I performed this upgrade to my Mega ST about two and half years ago, initially adding one Meg and then adding a further two a year later. I had a few problems to start with because my video shifter chip was not socketed. This meant that I had to solder a socket on top of the video shifter which then accepted the Marpet adapter (this is detailed in the instructions), it took a few goes to get this connection secure - it tended to wobble loose which then prevented the machine from booting up. I have had no problems since then.

Michael

Derryck Croker <DCroker@mettav.demon.co.uk> wrote in article

Hi ST-friends,

what's is going on with the gdos drivers for the nec p-series. They are all toooo slow.
When I am using an GDOS-Hardcopy program like rhocopy with the standard nec-p6 or hp-driver it takes 2 or 4 times longer than with a hp6-hardcopy program?
Of course standards like gdos are taking time (see Microsoft...) but not that much or?

Thanks to all of you.

Hardy

Happy new year Harry! (and to everybody else reading this ofcourse) ;-)

This is news to me. I thought checking the IC was good enough...

>This is going on memory, but I think the doubtful range of machines had a
>serial number that started either A19 300... or A19 301... only these
>machines had the DMA whose tolerance was too wide to work reliably.

Really? I'll ask him to check it out. This machine was bought here in
Norway though so it might not apply here :-(

>Also, no TOS 1.62 machines had the problem AIUI.

huh? But 1.62 is *the STe TOS* isn't it? I read several places that early
STe machines had a faulty DMA chip in them, and I don't know of any STes
with other versions of TOS in them than 1.62.

>If you're intending to drive the machine above its normal spec (ie 16MHz
>accelerator) then you *will* need the C398739... chip.

No, he's just going to run it plain.
Is there any other way to find out if his DMA chip is okay other than to
check the IC number then? If his existing DMA chip is okay he could save a
little money...
Any _reliable_ test perhaps?

Hallvard

u> HDDRIVER. You can get if by anonymous ftp from
u> acp5.chemie.uni-kl.de/pub/atari or http://acp5.chemie.uni-
u> kl.de/seimet/hddriver_english.html

I got hold of the version 5 demo. It saw the drive as with 3.51, but when I ran hardpart from v3.51 it did actually partition the drive. I rebooted and tried copying files to the new partitions, but after a few seconds I get a write error on the drive. When I checked all the files had been copied to _two_ partitions!

Will it work OK if I partition the drive with version 5?

Version 5 certainly allows read and write to a certain
extent, no other drivers have managed even a read so far.

Cheers.......Mark

What sector size does your partition have? If it's 32768 byes this is
out of GEMDOS scope and Kobold might refuse this.

> Any idea what the largest partition size that I can use with
> Kobold would be? 512meg?

It depends on the version of Kobold you're using. The current version
3.5 definitely supports more than 512 MByte per partition. I have it
running with a 650 MByte DOS compatible partition.

No, the original STe TOS was 1.60. This was the TOS with medium-rez
booting bug. It was, AFAIK, only some of these machines that were
affected by the faulty DMA chip. If you have 1.62, you should be OK.

You can also use a hard disk formatter for the Atari, e. g. SCSITOOL or
the tool coming with HDDRIVER. These tools do exactly the same as the
Adaptec BIOS does when formatting a drive.
Note that formatting a SCSI hard disk is an operation the hard disk
drive does completely on its own. The only thing that is needed is a
hard disk tool that sends the SCSI command FORMAT DRIVE to the hard
disk. This is exactly what the Adaptec or SCSITOOL or HDDRIVER software
does.
Nevertheless I'm afraid that if there is a drive which isn't able to
identify itself there is no way to revive it by formatting or any other
operation.

Hello,

A month ago I downloaded Mint 1.12 and installed it. I use it with an 1Gb
fujitsu SCSI HD and now I think it might cause any problems. Is there anyone who can
help me with this. Or is it because I have tos 4.02. And I suspect that this
tos version is causing the system to halt more than with later versions.
The X11 programs runs smooth on it though but with multitos it seems that
the mouse is causing some hardware problems.

Also I'd like to know if there are any newer versions of Multitos. I use the
4.0 file that came with my falcon.

Thanx

They sure did. I've had STe's with TOS 1.06, 1.62 and 2.06.
I've had 3 friends with the DMA problem. One was recent. She had the
machine on all day and it was a hot day.Late that night when she went to
save something, the DMA did the dirty on her and she lost everything on
the HD. The faulty DMA's work fine until they get hot.
TOS 1.06 is the troublesome batch.

Hi,

YES it is possible to connect an IDE harddisk to a ST computer (not STE). You have to solder the card on top of the CPU (64 pins). Then connect the IDE drive to the interface! A ST/STFM can normally only use a 2.5" drive as the original case is too small to contain a 3.5" drive. A Mege ST has room for a 3.5" drive.

The IDE interface contains TOS 2.06 which is required to use an IDE disk. This interface can be ordered from the German maker, Hard & Soft, Indigo 2 in Denmark or PM data in Norway (VISA card).

Price is about 100 pounds inc. TOS 2.06. If you are interested, I can give the adresses of the above companies.

Speaking of experience, it seams like most of these faulty DMA chips have been shipped to Norway! I have had a lot of trouble with STEs, and I was told this trouble had to do with a very hot CPU together with the DMA marked xxxx13, and that a cooling fan on top of the CPU could solve the problems. I have not tried this myself, but it is certainly a lot cheaper and less troublesome than removing the old chip and solder a new replacement.

I think good HP driver's mostly use compression of the raster
information which speeds up printing quite a lot. I think the NEC P6
doesn't support compressed raster graphics.
Also, if they are plotting 360x360 dpi as opposed to HP's 300x300 dpi
then there are 40% more pixels to transmit for the NEC.

Which resolution do you use for Hardcopies and which for GDOS printing?
You have the choice:
360*360 dpi^2
180*180 dpi^2
FX80 resolution
and much more

And then guess.

partitions!

Sounds funny. But what this means is that these partitions are not two
different partitions but are one and the same. For some reason you got a
single partition that got two drive IDs.

> Will it work OK if I partition the drive with version 5?

Note that the current version is version 6.1 with the demo version
available from acp5.chemie.uni-kl.de/pub/atari.

> Version 5 certainly allows read and write to a certain
> extent, no other drivers have managed even a read so far.

I think the only problem left is that partitioning went wrong, see
above. There were a lot of changes from version 3.51 (the one you used
for partitioning) and the current version. I'm quite positive the
current version will work because it does with other users. Note,
however, that the demo version of HDDRIVER doesn't support partitioning.

I have found "Diamond Back" ver 3.x to be reliable for my Archive tape backup unit. The only wierd thing was that I had to set the SCSI ID number of the unit myself because DB's autoscan could not detect it. Once it was set, however, the Archive unit worked like a charm.

Earlier versions of Diamond Back (2.x) do NOT support non-floppy backup devices.

Hope this helps,

Randy Kwak

109. How to make an internal clock for the STe?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-10 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <32d667828587e2@sn.no>
Source record: 18490

Does anyone have a circuit diagram for an *internal* clock that works with an STe?
Fortunately I got to buy one of those for my own STe (I installed it in the ROM sockets, and the EPROMS on top of the circuit board).

Unfortunately this clock isn't available any longer, and my dad could need a clock (setting the time each time the computer is switched on isn't exactly the most interesting thing to do!).
And installing all sorts of bulky stuff in the ROM socket isn't actually the preferred way to do it either.
So if anyone has some sort of internal solution I'd be happy to hear about it.

From: Jeff.Thomas@thebeach.to.org
Message-ID: <3f3_9701100900@to.org>
Source record: 18492

Has anyone out there ever tried overclocking their CPU? I've read in ST Internals that it's possible for the ST's 68000 chip can run at 10 or 12.5MHz. I've also been reading that supplying a faster clock speed to the CPU via an oscillator will speed up the CPU's bus. Question is will this work, or will it cause the CPU and the system bus to go out of sync?

Also I'm curious to know if anyone has tried adding a 68881 FPU to their system. I'm wanting to add one to aid in raytracing with POV raytrace.

I wish I could be more informative about this, but I have seen it before
with
software problems. It isn't very consistant and seems to happen when an
app
leaves the Falcon in a certian contition, not necessaraly a crash, and
in all
probability didn't clean up it's own mess. Just have to keep looking.
Could be hardware, but that would either be on or off, or when the
machine has
become hot a problem would occur.
Please keep us posted on what you find or post anyother related
information.

Mike

Possible but highly unlikely. Viruses that infect TOS-based systems are
relatively rare, and largely more annoying than harmful. If he were running
a PC, I'd say the odds of virus infection were about 85 percent, but on the
Falcon? Perhaps 10 percent.

That's a bit harsh. Most computers and hard drives have fans built into their cases, but not because they're faulty. You should always try and keep your machine
cool in hot weather to help prevent component failure on a machine like an STe that
doesn't have a built-in fan.

h>
h> Happy new year Harry! (and to everybody else reading this ofcourse) ;-)

And to you B^{)

h> This is news to me. I thought checking the IC was good enough...

No. The rumour was that the DMA was originally specified for the STFM and
expected to continue to work in the STe until it was found that while the
spec was
ok, the tolerances to which it was made were not acceptable with the STe. The
chip
number used for replacements was exactly the same.

>> This is going on memory, but I think the doubtful range of machines had
>> a serial number that started either A19 300... or A19 301... only these
>> machines had the DMA whose tolerance was too wide to work reliably.

Not a bad memory - the range is A19 B300nnnn to A19 B301nnnn which indicates
20,000
machines, although somewhere else ISTR someone saying 12,000 so maybe they
were just
playing safe with this number range? (I'm guessing).

>> Also, no TOS 1.62 machines had the problem AIUI.
h> Huh? But 1.62 is *the STe TOS* isn't it? I read several places that
h> early STe machines had a faulty DMA chip in them, and I don't know of
h> any STes with other versions of TOS in them than 1.62.

Personally I've never seen a TOS 1.62 machine <g> the ones I've had were TOS
1.06
with the med-rez bug. I've still got the one that Atari fixed and returned
to me
free of charge (Serial no A19 B300 5804) and one other that didn't need
fixing (A19
B302 02nn) which I got for my brother - both TOS 1.06.

h> Is there any other way to find out if his DMA chip is okay other than
h> to check the IC number then? If his existing DMA chip is okay he could
h> save a little money...

h> Any _reliable_ test perhaps?

AIUI the only test was to start the machine and repeatedly copy files fr
partition to another for 30 minutes, after which data corruption would occur
(or
not, as the case may be). I think Atari approved repairers had some software
that
automated this. My own repair report indicated a 24-hour soak-test.

Apologies if I got this post late and it has already been replied to (as I suspect) but in case it has not:

There are IP addresses reserved for use outside of the internet. If you use these, you will not have any problems, and this is what I was meaning when i posted that. Perhaps I didn't make it very clear. Unfortunately, however, I have forgotten what these addresses are, although 10.x.x.x springs to mind. Maybe someone else can help.

131. What kind of harddisk works with "ICD Link (I)"?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-12 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <32d8e7de24eb71@sn.no>
Source record: 18362

I'd like to know what kind of harddisk will work with the original "ICD Link" host-adaptor (not the "Link II"!).
I seem to remember something about parity regarding this adaptor- does the drive need to have it enabled or disabled?

Any recommendations for a nice, quiet SCSI drive that works with it? It doesn't have to be big at all. I guess 340 Mbytes is enough.
And being quiet is an important issue as the computer is mostly going to be used for MIDI sequencing- a buzzing drive doesn't exactly contribute to concentration/inspiration....

133. For Sale

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-12 00:00:00 UTC
From: dwmoar@aol.com
Message-ID: <19970112203000.PAA02596@ladder01.news.aol.com>
Source record: 18364

I have a Compatibility Plus II Board for sale. This board allows the users of the 520/1040/ and Megs ST to upgrade TOS from the early versions(1.0-1.04) to the newer TOS version 2.06. Comes with a simple to install board (just plun into the 68000 CPU socket. Original installation manual and accessories disk and a new 68000-8 processor. The Compatibility Plus II board also will allow you to switch between TOS 2.06 and your older TOS roms with the simple addition of a SPST switch (explained in the installation manual)

I have only the one board for sale at $60.00 which includes shipping and handling anywhere in the good ol USA. For COD orders add $6.00 to the abover price. You will still have to buy the TOS 2.06 chipset. This should cost about 50.00 - 60.00 from Best Electronics or Toad Computer or Computer Direct.
You can contact me on Ace of America (503)761-9074 - 300-28.8 baud User # 53 (Atari*Dave) or e-mail me at dwmoar@aol.com

134. Graphics Display on 1040ST

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-12 00:00:00 UTC
From: Jason Fergus <leech@aros.net>
Message-ID: <32D95324.113C@aros.net>
Source record: 18365

I just aquired a 1040ST for a fairly good price (I needed something to play all my old games on, and my TT either runs too fast, or the 50hz games won't work since I don't have a multi-sync monitor) but it has a display problem. Lines appear vertically without color or the incorrect color. It really looks nasty. I tried reseating the chips, but that didn't do aby good.

I have a Mega STe that's just sitting up on my shelf because it died quite a while ago. The problem is that it boots up just fine, but it won't let me access the Floppy drive or the Hard drive. I know the floppy is working, because i put it inside my TT and it worked fine. I even tried putting my harddrive from my TT into the Mega and it still didn't do anything. Tos I know still works in it because it still boots up to the TOS screen after an agonizingly long time (because it can't find a media to boot from). Please help! I'd love to be able to fire it up again and network my 3 ST's together (TT030, Mega STe, 1040ST).

Re: Re: Mega Internal DMA pinout
St: Rcvd
---------------------------------------------------------------
Hi Greg, i read your following message:
GT> Hi All,
GT>
GT> I was wondering if anyone here had the pinout for the internal
DMA
GT> connector on a Mega ST? I have aquired an ICD micro host adapter
and
GT> wanted to see if I could wire it up to the DMA on my 520STFM.
GT>
GT> The connector is a 24 pin, instead of the standard DMA 19, I
assume
GT> that two of the extras are power and ground for the host adapter.

Here you have the info for J17:
1 gnd 2 hd0
3 !reset 4 hd1
5 gnd 6 hd2
7 gnd 8 hd3
9 gnd 10 hd4
11 !hdack 12 hd5
13 gnd 14 hd6
15 gnd 16 hd7
17 gnd 18 hdcs
19 ca1 20 gnd
21 gnd 22 cr/!w
23 hdrq 24 !hdint

Keep in mind that this connector is numbered from side to side while
the DMA external is numbered down one side and up the other.
```

My Syquest has been working fine with this arrangement for some time now.

> |> E |\| |-| /\ |_ |_

I have a Syquest ez135 hooked up to my ST using Linc II. It was as
easy as you described. Took me all of 10 minutes. Really plug'n'play.
I don't know about the Iomega Ziip tho. The EZ is supposed to be
faster and the disks give you an extra 35 Megs for about $30 as
opposed to the IO's $20. Syquest for some reason is not pushing the
product, maybe they feel it cuts into sales of their higher priced
lines. I also use it with my doze for back-ups with an Adaptek board.
Setting that up was another kettle of fish, however, but now I can
simply change disks and exchange serial ports and"voila'.
ciao Larry

YES, I,ve done this for the past few years. I have the CPU running @ 16 Mhz when it's not accessing the bus, jumps back to 8 when it wants to talk to the hardware.

> 12.5MHz. I've also been reading that supplying a faster clock speed to
> the CPU via an oscillator will speed up the CPU's bus.

I used the original CPU, with a small circuit that monitors the AS line @ switches the CPU clock between 16 Mhz (from the shifter pin) and 8 Mhz.

Question is will
> this work, or will it cause the CPU and the system bus to go out of sync?

Not if you do it this way, because the new clock is phase locked to the old one.

It makes a big difference in speed for DIV/MUL's/bit shifts.

>
> Also I'm curious to know if anyone has tried adding a 68881 FPU to their

You have to make a simple adapter for the ROM-port. There are drivers in the current MiNTnet-distribution, and perhaps instructions on how to make the adapter too.

Browse the usual ftp-sites (ftp.fu-berlin.de is good for MiNT-stuff.) and look for a package called something like tuw-tcp.lzh. It contains all the necessary instructions for this adapter, as well as drivers for TOS.

I believe addresses like 192.168.0.1, 192.168.0.2 and upper are just
reserved for this purpose, but I don't know if it's a class C or B, that's
if 256 or 65536 addresses are reserved... I use only these 2 for my Falcon
and STe network, if you have a more than 256 computers network, verify the
addresses in the relevant RFC!

Such addresses are reserved for local area networks, and if the LAN is
connected to the Internet, and by error a paquet goes out with such an
address, it will not do any harm as it will not be routed...

Bye! Bruno.

145. Falcon 030 problem

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-13 00:00:00 UTC
From: Dan Phillips <xiting@worldnet.att.net>
Message-ID: <32DB0497.3FD@worldnet.att.net>
Source record: 18376

Okay,

I finally got something positive to happen in my attempts to upgrade the Falcon processor. To refresh: I have a Blow FX and was running at 36 MHz (with two fans and the heat sink on the CPU). The chip ran too hot to crank up to 40 MHz, so I figured why not upgrade the processor to something that will handle the speed. My first attempt was an MC68030FE33 (the TT processor). All I got was a dark purple/black screen.

Today I installed an MC68EC030FE40 in the hopes that the problem was tied to the MMU in the Combel chip not expecting the true '030 onboard MMU. Now I get the white screen with the Fuji logo, the IDE drive spins up, the floppy light comes on, and... nothing. It just sits there. I don't even get a keyclick with the keyboard disconnected.

Any ideas what could be hanging the machine?

TIA,
Dan

I think you're out of luck. On a monitor, one can fiddle with the size
and position controls to get a reasonably large and centered picture, but
the LCD projector is probably more fussy. You might have to resort to a
graphics card; my Crazy Dots II outputs a beautiful picture (no fiddling
necessary) even on my cheapo SVGA monitor.

151. TCP/IP stack

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-13 00:00:00 UTC
From: Jake Goerzen <goerzen@psnw.com>
Message-ID: <32DA92FE.DFC@psnw.com>
Source record: 18382

Why is it that MagiC still doesn't have a TCP/IP stack comparible to MintNet? I am not slamming STiK, it just that STiK doesn't have PPP yet. Without tcp/ip and PPP MagiC is of little use to me. My ISP's SLIP implementation is just not compatible with STiK. What makes a tcp/ip stack so difficult to program for MagiC?

Jake

152. PLEASE READ!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-13 00:00:00 UTC
From: William.Mccullough@thebeach.to.org
Message-ID: <42e_9701150902@to.org>
Source record: 18383
Body handling: Inline uuencoded payload not displayed: spam.nws

READ THIS ARTICLE AND IT WILL CHANGE YOUR LIFE.
BELIEVE ME I DIDN'T THINK IT WOULD WORK BUT HEY,
I'M $50,000 RICHER NOW.

Well, I thought this thing would be just as much bull shit as all the other get rich things. I thought it wouldn't work at all and that I was just wasting my time but hey, believe it or not it worked. For just $5 that I spend on this I got $50,000 . I've thought of this a lot and it make's sense, if everybody is honest in this system everybody will profit from it.

HERE'S WHAT YOU GOTTA DO!

STEP 1.

Invest your $5 by writing your name and address on five seperate pieces of paper along with the words, "PLEASE ADD ME TO YOUR MAILING LIST." (In this way, you're not just sending a dollar to someone; you're paying for a legitimate service.) Fold a $1 bill, money order, or bank note inside each paper, and mail them by standard U. S. Mail to the following five addresses: (USE INTERNATIONAL POSTAGE WHERE NECESSARY)

1. Mitchell Kanashkevich

11/160 Oberon St. Coogee 2034

NSW, Sydney, Australia

2. Rest Dandy

Kapellestraat 61

8450 Bredene

Belgium

3. Heiko Wrede

Grabenstr. 28

33647 Bielefeld

Germany

4. John Beckwith

17/144 Nicholson St. Coburg 3058

VIC, Melbourne, Australia

5. William B McCullough

51 Springbrook Drive

Richmond Hill, ON

L4B 3R6 CANADA

STEP 2.

Now remove the top name from the list, and move the
names up.This way, #5 becomes #4 and so on.
Put your name in as the fifth one on the list.

STEP 3.

Post the article to at least 200 newsgroups. There are at
least 17000 newsgroups at any given moment in time.
Try posting to as many newsgroups as you can.Remember
the more groups you post to, the more people will see your
article and send you cash!

STEP 4.

You are now in business for yourself, and should start seeing
returns within 7 to 14 days! Remember, the internet is new
and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 200 posts I made, I got back 5 responses.
Yes, thats right,only 5. You make $5.00 in cash, not checks or
money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 200
additional postings with your name at #4, 1000 postings.On
average then, 50 people will send you $1.00 with your name at
#4,....$50.00 in your pocket!

Now these 50 new people will make 200 postings each with your
name at #3 or 10,000 postings. Average return, 500 people= $500.
They make 200 postings each with your name at #2= 100,000
postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 200 postings each with your name at
#1 and you get a return of $50,000 before your name drops off
the list.And that's only if everyone down the line makes only 200
postings each! Your total income for this one cycle is $55,000.

From time to time when you see your name is no longer on the list,
you take the latest posting you can find and start all over again.

So thats it. Pretty simple sounding stuff, huh? But believe me, it
works. There are millions of people surfing the net every day, all
day, all over the world. And 100,000 new people get on the net
every day. You know that, you've seen the stories in the paper.

So, my friends, read and follow the simple instructions and play
fair. Thats the key, and thats all there is to it.Print this out
right now so you can refer back to this article easily.Try to keep
an eye on all the postings you made to make sure everyone is
playing fairly. You know where your name should be.

REMEMBER....HONESTY IS THE BEST POLICY.YOU DON'T
NEED TO CHEAT THE BASIC IDEA TO MAKE THE MONEY!
GOOD LUCK TO ALL,AND PLEASE PLAY FAIR AND YOU WILL
WIN AND MAKE SOME REAL INSTANT FREE CASH!

The hardware is availiable from Dallas Semiconductor Inc. try the web
address http://www.dalsemi.com/ the part is a DS1216F Smartwatch.
An Application note 4 gives the various hardware options.
The Application note 52 defines the registers and gives sample code
in a pseudo code (looks like fortran) and 8051 Assembly lang.

Source record: 18387

This message from Jeff.Thomas@thebeach.to.org to All came in on a wing and a prayer...

Hi Jeff!

JT> Has anyone out there ever tried overclocking their CPU? I've read
JT> in ST Internals that it's possible for the ST's 68000 chip can run at
JT> 10 or 12.5MHz. I've also been reading that supplying a faster clock
JT> speed to the CPU via an oscillator will speed up the CPU's bus.
JT> Question is will this work, or will it cause the CPU and the system
JT> bus to go out of sync?

This won't work as the processor will need to access the bus at 8MHz AIUI. The solution to your problem would be met by one of the 3rd party accelerator boards such as ICD's AdSpeed (16MHz) or a PAK card (speed depending on the size of your wallet, may accept an FPU as well, not sure on this point). Both these have on-board cache memory that will minimise as far as possible the number of times the processor has to return to 8MHz to fetch more instructions etc etc etc.

Speak to 'ya later!

> Regards, Robert
>

Now you tell me. Where have you been? I guess I must've posted the original question during a time when you weren't checking the newsgroup closely. So, is there a way to hack an '030 or an 'EC030 down to the Falcon's level? Or do you know someone from the Falcon development team that I could try to ask?

Atari _deserved_ to go out of business. 7 years with standard Motorola processors, then the schmucks go with a custom CPU. Putzes, all of 'em. Of course this assumes the above info is 100% accurate. Sorry for the tirade, but _JEEZ_, you'd think with all the accelerator development that went on for their machines, they'd maintain the most critical part of making their machines useful. I _can't_ live with 16 MHz, and neither could any power user, even in 1992. Yeah, I know, that's what the expansion bus is for, but I'm already using the bus and would like an inexpensive accelerator, not an $800 sub-computer.

RIP Atari,
Dan

Anyone want to buy a F030 4/2, 8, or 10/84 w/ Lighthouse Tower and Freekeys? Runs great at 36 MHz, too slow for me.

161. Looking for schedule to link Jaguar to SVGA

Yes a small program in the auto folder at bootup to redirect the bios
calls
> It won't work with the usual Atari software then?
The "usual atari software" as I recall (no docs here) make bios calls
to set and get the date/time.
On the STe this is a counter kept in RAM, on the TT a MC146818A I/C is
used and a small battery keeps the clock ticking.

The DS1216F also has a small battery integrated into the socket holder
and performes the same function.

So all the "usual atari software" should work without problems.

A clock module for Atari's should have the same configuration as the one
in the (I think) Meag ST. By configuration, I mean it should have the
same registers, in the same loactions as the Mega clock.

There are some clock addresses in the hardware register listing, it should
not be too difficult to wire up a clock chip to an ST(E).

Actually, you can put your clock hardware anywhere, as long as you have a
program that can read/set it.

AFAIR, there is another clock in the keyboard.

I remember something about clock programs that would read the time from
the clock module, then set the clock in the keyboard.

GEM only reads one of these (most probably the keyboard) so as long as
this is set by whatever hardware & software combination you have, then all
Atari software (clock DA's, etc) should be able to work correctly.

168. Oasis 1.35 patches

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-15 00:00:00 UTC
From: bkozlowski@nordnet.fr
Message-ID: <853354824_OASIS_@nordnet.fr>
Source record: 18302
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,demon.ip.support.atari

[followups directed to the Atari tech group only]

Hello all!

Some time ago in a discussion with Guy Harrison we found that Oasis doesn't give environment variables to called programs, like NOS or an external editor. And this is a problem for time and timezones in NOS, to find INF or KRZ files for Everest, etc...

Here is a little patch to correct the bug: edit OASIS.PRG with a binary editor, find the sequence 2F4A 0012 (there is only one in 1.35, at +30D96) and replace it by 42AF 0012. This changes a move.l to a clr.l for the envp parameter of a gemdos Pexec call.

Note to pre-1.35 users: if there is more than one sequence like this, try to find 2F4A 0012 205F 74C8 (and edit only the first word). And don't forget to edit only a copy...

Now NOS receives all your environment variables, like TZ=MET-1 or NOS_ROOT=j:\oasis (without trailing backslash). NROWS=30 does not seem to work, at least in NOS_POP3. And Everest receives EVEREST=e:\utils\texte\everest.35e\ (with a trailing backslash this time) and finds it's config files in it's own directory, no need to maintain a copy in J:\OASIS\.

But now you have a problem, if you have a TZ variable you have a double correction in NOS: the TZ offset and the system clock changed (to GMT) by Oasis... and you're fed up with Oasis changing the clock, with all related problems (innaccuracy, crashes...). 3 bytes to change, and it's history: always in OASIS.PRG go to +1853, +2FFCD and +30067, and there replace bytes 41 by 71. This changes trap #1 (4E41) calls to gemdos Tsettime and Tsetdate to nop (4E71).

You can also change the "s" of "Organisation:" to a "z", and replace twice two underlines(?) "__" by two minus signs "--", the first time is the mail sig separator, the second is for news. No, I don't know how to add a space at the end...

Bye! Bruno.

PS: Do you have a backup of OASIS.PRG? Sure? Because I perhaps made a mistake typing this text, or there is somewhere a side effect I haven't detected in two days of use...

I would recommend 7-Up, then (7 files at once, limited only by available RAM
as far as I can see). You can get it from
ftp://ftp.teleport.com/users/atari/7up_engl.lzh
or many other locations.

j>
j> It's a pity there wasn't any advance warning in the manual :-(

Everything has a maximum and minimum operating temperature range.

j> We could try glueing a heatsink to the DMA chip........
j> or a fan...........
j>
j> What do you think?

We don't have this problem in England B^{)))

Think of it as a punishment to balance all the good weather you have B^{)

Alternatively, by a cheap fan and put in your room - I was thinking of doing
that last summer when the graphics card was playing up. Cooler air
circulating in the room is sure to help.

171. Some questions about the TT030

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-15 00:00:00 UTC
From: gstamant@cedep.com
Message-ID: <32dd35d4.1719921@news.cedep.com>
Source record: 18305

Hi everyone,

I've been using a TT030 (TOS 3.01) with the standard PTC1426 monitor
for a couple of months now and would appreciate if anyone could answer
any of the following questions:

- I've tried using a standard VGA monitor with it, but it didn't work.
Is there an easy way to make it work? Will a SVGA monitor work?

- What type of SCSI HDD does it need? What about SCSI-2 drives?

- Is there a way to set the white screen contour to black? (in color
modes)

- Will all ST High Resolution compatible software run in TT High mode?

Thanks in advance,
Guy.

Guy St-Amant, Montreal

Oops... sorry about that. I did however have the proper address for
Hard & soft, and here are their phone and fax numbers as well:

Phone: 02305-18014 (Mon-Friday 09.30-13.00 and 14.00-17.15)
Fax : 02305-32463

(The international access code for Germany is 49, and you probably have to
omit the first "0" in the phone numbers if you're calling from outside
Germany).
I haven't heard of any email address for them either.... :-(

So does this mean that special software has to be run in order to use it?
It won't work with the usual Atari software then?

>This sounds like the elusive Dallas RTC "smart watch" module.

Nope. I bought the clock from Indigo 2 in Denmark
(http://194.19.145.26:80/users/indigo2/) who had in turn bought it from
Hard & Soft in Germany. It's called the "Mega clock" and came with a small
German manual describing the installment etc.

It's a small circuit board containinga Ricoh RP5C15 and a 74HC688 chip
along with a crystal oscillator and some resistors etc. The battery is an
external 3 Volt (2 "AA" batteries in a battery case to be mounted
underneath the power supply "metal-top cover", but I thought this was
pretty bulky, so I used a small 3V watch battery instead (more "computer
like" you know ;-)

The circuit was placed in the "low" EPROM socket for the TOS chips and the
"low" EPROM was placed on top of it again.
In addition two wires from it were connected to different places on the STe
main-board (a resistor, and to the 68000 processor I believe).
It came with a time-setting disk, but I have no problem setting it with
other programs (such as the "Xcontrol" control panel).

No, you're misunderstanding....
I already have the clock which I just described in my STe- and it's working
fine, but my dad (who also has an STe) is in need of a clock as well (so he
won't have to set the time each time he uses the machine), and since the
clock I got for mine isn't available any longer I'm looking for another
solution.

From: Dale Needham <needhadp@sparcdii.derby.ac.uk>
Message-ID: <32DCA9D2.DA4@sparcdii.derby.ac.uk>
Source record: 18394

Hello,
I to have had problems with MiNT on a falcon, Mostly when using
Minix & mint 1.12. Problems of the sort that the machine will run upto
about 5 seconds after a minix partition is accessed then it crashes. I
have never had the disk space (65MB) to run X in any form. So I cannot
comment on that. Personally I use Geneva 5 since the AES with TOS 4.02
is rubbish and AES 4.00 with multitos is little better.

I have no idea how to get a newer AES file, but geneva works fine
and when combined with teradesk is good enough. Pity the poor machine
though it isn't fast enough for some things (raytracing etc, no I don't
have an FPU) but as a word processor it works well enough.

Personally now I have a PC, and will suffer with windows 3.1(I hate
File manager & program manager, where is a desktop when you need it?)
and will continue to do so until I can add the memory & disk space to
run Linux & STonX.....

Happy hunting.

178. Re: Problem Quantum F-ball > Falcon

Greetings,

As I am experiencing disappointment with the performance of my new
A/V SCSI drive, I was wondering what kinds of data transfer rates others
of you are getting as indicated by ICD RATEHD.

My drives perform as follows:

Quantum 540meg SCSI drive 1700k/sec
Seagate 1.2gig IDE drive 1900k/sec
Seagate 4gig SCSI Wide drive 1400k/sec (Eeek!)

Specs say the Seagate 4gig will do 20meg/sec, I estimated 5-10meg/sec in
that I'm not connected to the Wide data lines. 1.4meg/sec I just can't
understand.

Any ideas regarding the maximum data transfer rate that the Falcon SCSI-II
port can handle?

I would add that the ZIP drive doesn't feed TERMPWR to the SCSI bus, the Link host adaptors require this to power them. In the normal course of events this isn't a problem if another device is already providing this voltage, but a problem will arise if you try to use the ZIP drive by itself.
l> faster and the disks give you an extra 35 Megs for about $30 as
l> opposed to the IO's $20. Syquest for some reason is not pushing the

>I have troubles running Cubase 2.0 under TOS 2.06 on a Mega STE 4.
>It works proparly under TOS 1.04 on a 1040STfm.

I haven't used Cubase (I'm a Notator SL person myself ;-),
but what is written about using it with the Mega STe might apply for you as
well:

It says that you should go the the control panel (Xcontrol), the "general
setup CPX" and set it to: 16MHz, cache off

Furthermore these CPX modules and program have to be disabled:

wcolors.cpx
color.cpx
maccel.cpx
maccel3.prg (in the AUTO folder)

Hope this helps.

Any SCSI-2 drive will do. Note that you can't boot from Quantum Fireball
SCSI drives. Some drives require initiator identification. In this case
you need CBHD, HuSHI or HDDRIVER as hard disk driver.

> - Will all ST High Resolution compatible software run in TT High mode?

No. Some programs expect the screen to have exactly 640x400 pixels. A
good place for such software is the trashbin. Modern software can cope
with any resolution.

You didn't mention if it was a single or double sided drive?

Either way, it sounds like your drive is busted. You could hewever
try using a floppy drive cleaner disk. If this dosn't work, then I am afraid
that you may have to buy a new drive. (I think that you can use 1.44MB drives
for IBMs but it will only use 720K though)

Cheers,

Brian T. Innes

Why dont you try taking the guts of an external clock cartridge, and
connecting all the connectors on the cartridge to all the corresponding
connectors of the actual CARTRIDGE PORT. If you use ribbon cable, then you
can then place the clock circuit inside your ST(E) somewhere.....

I havent actually tried this, but it may work.

You need atleast a 68030 to run linux, so unless you install a PAK-board
you can't run it on your MSTE.

Drives manufactured for Apples computers used to (maybe still do) have
special firmware that the computer would check. If you tried to use the
standard (non Apple) drive, the computer would not recognise it.

Atari's don't care, so it should work.

Why not try before you buy?

If the drive is a Quantum Lightning it will not work with the Link I. The
Lightning drive requires parity which the Link I doesn't deliver. You'll
need Link II or you can build your own parity generator as described in
this group recently. This is what I experienced myself when installing a
Lightning drive in a Mega STE. The SCSI controller inside the Mega STE does
not deliver parity either, and I had to replace it with a new controller.

What makes you believe that your ISP's SLIP is incompatible with STiK's ?
Is it the fact that your provider is too stupid to switch off Van
Jacobson Compression in their software ? I do not know any case where
STiK does not work with an uncompressed-slip account.

Why do you say that you're not slamming while you do so ? It's for
impatient people that we STiK programmers spend our nights to improve
STiK. I'm 95 % sure that within a few months STiK will have both Van
Jacobson compression (CSLIP) and PPP. Are you satisfied then ?

Cheers Peter

It's a class C network, 256 addresses.

> Such addresses are reserved for local area networks, and if the LAN is
> connected to the Internet, and by error a paquet goes out with such an
> address, it will not do any harm as it will not be routed...

The latter is something only you believe !

Two things :

a) If I remember right then the wording of the original message was such
that the author would use a randomly chosen address, not necessarily one
of those "free" addresses.

b) To all those people advocating use of the "free" addresses 10.a.b.c or
192.68.0.x : Are you aware of the fact that datagrams with those
addresses not only must not be routed to the open Internet, but Hosts
with such addresses should not even be *connected* to the Internet ?
Have you ever read RFC1627, labeled "Network 10 considered harmful" ?

Cheers Peter

->it up again and network my 3 ST's together (TT030, Mega STe, 1040ST).
->
->Leech!@#$
```

Sounds like your drive IO card is bust. It't the little gizmo that
sits above your motherboard and has ribbon cables running to the floppy
and hard drives. Check the connections first. That was my problem once.

Doug Hohenstein Without questions, there is no truth.

: - I've tried using a standard VGA monitor with it, but it didn't work.
: Is there an easy way to make it work? Will a SVGA monitor work?

Yes, although it won't be completely satisfactory. You'll have to adjust the horizontal and vertical sizes and positions in order to get a relatively large, square-pixel screen. You'll still have large white borders, though. I'm speaking from my experience with my cheap Magnavox SVGA; you may have better luck with a higher quality SVGA monitor or a multisync.

: - What type of SCSI HDD does it need? What about SCSI-2 drives?

Any SCSI or SCSI2 hard drive will work.

: - Is there a way to set the white screen contour to black? (in color
: modes)

Other than setting colour 0 to something other than white, no, not that I know of. Of couse, you can always get a video card, which will solve both this problem and give true VGA/SVGA output.

: - Will all ST High Resolution compatible software run in TT High mode?

Any well written GEM software will run in any resolution and colour depth. However, not all software is well written. Even relatively well GEM'ed software such as Opus refuses to run in TT Hi, despite that fact that it works just fine in ST Hi. There is, I believe, a utility which emulates ST Hi in TT Hi, essentially by doubling the size of the pixels. This may work for your needs.

The floppy cable connection is directly on the m/b in the MSTe, Doug. I
tend to suspect either a micro-crack in a motherboard trace, a bad chip, or
partly-unseated chip(s).

Checking the connections is alwasy a good first step, however.

I believe that last part is inaccurate. There is a demo version, but it is
limited to one partition and none of the caching features, partition, or
formatting are available.

>Is there an easy way to make it work? Will a SVGA monitor work?

I'm using a standard VGA and it works fine in all 5 of the lower
resolutions, from ST Low to TT Medium. Mine is an Arche VGA-C if that helps
at all. I see no reason any SVGA shouldn't work, but I also see no reason
to spend the extra money for an SVGA monitor, since available resolutions
meet the VGA standard.

>- What type of SCSI HDD does it need? What about SCSI-2 drives?

I have a Seagate 1.2 gig ultra-slim internally, and a Toshiba 2x CD-ROM on
the external SCSI port. The major differecne between SCSI and SCSI-2 is the
command set; HD Driver should take care of that (I'm using AHDI at the
moment, until I can afford HD Driver).

The server (my "other" TT) is using a Seagate 4 gig Ultra Wide Fast SCSI-2
drive, two Matsushita 1x CDs, and an Archive Viper tape drive, under ICD's
drivers. No known problems.

>- Is there a way to set the white screen contour to black? (in color
>modes)

If you mean the extra space around the display, probably not.

>- Will all ST High Resolution compatible software run in TT High mode?

Depends on the programmer. I know a lot of the stuff I wrote before I got a
TT is totally ignorant of TT resolutions, and will give an error message if
you're not in an ST rez.

No. The parity jumper is soldered in place on this drive (and all
Apple-labelled drives that I have seen). You'd have to have an AdSCSI+ or
Link-2 (or Link 96) to use them.

It is possible to remove the jumper - but it's on your own risk when you go
putting a soldering iron on a hard drive.

>ftp://ftp.teleport.com/users/atari/7up_engl.lzh
>or many other locations.

Yes, there are several versions available. Version 2.09 is the smallest of
the 3 I have, and in English, version 2.2 is a better one, but is in German
(though I've included an English file of some sort- I forgot what it was)
so it's partly in English, and version 2.30 is the biggest one (too big for
my taste- I need a small, fast to load editor) which is in English.
You can get them all at:

<ftp://ftp.sn.no/user/hallvart/atari/>

Size Filename Description

115K 7up209.zip 7up v2.09 ASCII text editor
185K 7up22g.zip 7up v2.2 (German/partly English) ASCII text editor
824K 7up232.zip 7up v2.32 ASCII text editor (with TeX docs)

Other editors available at the same site/directory:

67K edith1_0.zip Edith ACSII text editor (can run as ACCessory or PRG!)
127K evrst35e.zip Everest 3.5 (English) ASCII text editor w/HTML template

Most people use either Everest or 7Up. It's a matter of taste really, but I
find them both really good, and they both have different features which are
very useful. I suggest that you try out both 7up 2.09 and Everest.

hmm from what I saw RATEHD is not teh prog to test the speed your
drives.. Here it is totally inaccurate..
For a JAZ it says 850kb/sec!!!!
When my old scsi1 340 meg do 1000kb/sec in ratehd..
And the JAZ can do up (min 3.4 meg/sec- max 6.5meg/sec)
If I use Howfast the results are totally different..
I get the JAZ faster than my old scsi 340..:)
I have for the JAZ and howfast.prg 1.5 meg/sec .
And the old scsi 340 it says 0.6 meg/sec , which is closer to the
reality.
From what I understood, teh scsi port of the falcon has a max of
2meg/sec.
So if you have 4meg/sec you won't see any difference..
On the IDE however it can go up, way up...
But for Cubase audio, if your scsi drive can do 1.8meg/sec then the
whole 16 tracks are available no problemo. (should).
But an IDE at 3 meg/sec won't do it. :p
Caubase audio uses special scsi command that would suffice for your
scsi drive.. At 1.8 meg /sec. you have plenty..
Bye..

203. Quantum LT harddisk with "ICD Link (I)"?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-16 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <32ddad1632f2306@sn.no>
Source record: 18334

I'm in the midst of setting up a harddisk system for my dad's STe...
He's already obtained an "ICD Link" SCSI host-adaptor
(the first model, not the "Link II").

I've also gotten in touch with someone wanting to sell his 350 Mbytes SCSI
harddisk which he's been using in his Powermac 6100.
I told him to look up the drive model etc. and he told me that this was
what a label on top of the drive told him:

Apple Computer Inc
Internal 3,5 inch HDD 350 Mb SCSI
Firmware 1994
5/12 V 500/300 mA Quantum ProDrive LT

So it seems as if it's a "Quantum LT" unit. (is it a "Quantum Lightning"
drive?)
Will it work with the abovementioned SCSI host-adaptor?
What about formatting- does having Apple firmware in it have anything to
say?

Hoping for positive replies ;-)

Why not just pull the relevant code from the MiNT-net drivers? The PPP
and CSLIP in there has been stable for ages.....again, not a criticism
(I know what they feel like, you should see my mailbox full of folks
complaining about XaAES not being finished, or not working with
some obscure graphics card, or MiNT kernal version 0.1, or they don't
like the window borders, or... sorry, I digress). Anyway, just a
suggestion.

As far as I know, it's not the limit of the SCSI bus itself, but of the DMA
chip Atari has built into the Falcon. Is that correct?

Ciao

Thomas

There is no freeware version of HDDRIVER, only a demo version. The demo
version (acp5.chemie.uni-kl.de/pub/atari/hddriver61_demo.zip) has some
limitations. I can't write on any other partition than C: and even on C:
it writes quite slow. You can't configure your SCSI or ZIP/JAZ drives.
You can't format or partition your drive.

I'z wondering...
Will a Fast Wide SCSI drive work with a Falcon 030? Any extras needed if
it will?

Thanks
Brian

>special firmware that the computer would check. If you tried to use the
>standard (non Apple) drive, the computer would not recognise it.

Yup. I know that by experience, because I tried to format one of my
harddisks with my brother's Mac, but it just couldn't recognize it!!
Then I was told that Apple's own formatting software only formatted Apple's
own drives.
I talked with the local dealer where my brother had bought his Mac, and the
salesman gave me a program called "FWB hard disk toolkit" (the original
program and manual that is)!!!
After that I had no problem at all formatting my drive on the Mac- even a
low-level format!

>Atari's don't care, so it should work.

I hope you're right. I mean, I know that Atari's (or other machines for
that matter) don't look for specific harddisk firmaware codes like the Macs
do, but I'm a bit worried about an Apple harddisk with that firmware
causing problems when I use it with an ST.....?

>Why not try before you buy?

Yes, I'll suggest that to the guy who's going to sell it- probably the
safest bet. But I'd like to find out as much as I can first, so I won't be
wasting the other guy's time by checking out something which won't work for
sure.

> As far as I know, it's not the limit of the SCSI bus itself, but of the DMA chip Atari has built into the Falcon. Is that correct?

Yes, it is. The SCSI transfer speed of TT and Falcon is limited by their
DMA chip. Their seems no way to lift this limit by additional hardware.

I beleive the word I used was "unused" or something of that nature. Either way, what I was meaning was one of the addresses reserved for use outside of the Internet.

>b) To all those people advocating use of the "free" addresses 10.a.b.c or

> Have you ever read RFC1627, labeled "Network 10 considered harmful" ?

Oh. Something made me think that the machine could be connected to the internet as long as it did not use the internet with that address. E.g., if I set my computer to 10.1.2.3 and plug it into the internet, but don't actually send any packets with it, how can it harm anything?

Either way, it seems that you are right in saying that the machine may not even be connected to the internet. In that case, it would be necessary to obtain two IP addresses, one for the machine you actually want to use, and one for the intermediate machine (in answer to the original query which started this thread).

>Is there an easy way to make it work? Will a SVGA monitor work?

Normally, any (S)VGA monitor should work on the TT030. In this case, it would appear that there is either something wrong with the TT030 or the monitor. AFAIK.

>- What type of SCSI HDD does it need? What about SCSI-2 drives?

Any SCSI device can be connected to the TT030. AFAIK, any SCSI hard disc drive on the TT030 SCSI bus can be accessed, except that drives requiring initiator identification or bus arbitration require a special driver (such as HDDriver, HUSHI or CBHD) and cannot be booted from. If I have anything wrong about the bus arbitration and initiator identification, no doubt someone else can correct me.

>- Is there a way to set the white screen contour to black? (in color
>modes)

Apart from the changing the palette, I do not believe there is any way. But if there is, I would like to know about it too.

>- Will all ST High Resolution compatible software run in TT High mode?

Assuming the software is "cleanly written" then it will. If the software is not "cleanly written" then you should contact the programmers and ask them fix it.

Generally most "serious" software should be fine. None of the software I use every day has any problems running in any resolutions.

Assuming you have the cable adapter necessary, it will work on the ST. I have an Ultra Wide Fast SCSI-2 drive on the BBS, and it was previously connected through an AdSCSI+ to the MSTe motherboard - currently it's on the TT internal SCSI chain. Also, I understand John Perez is using the identical drive on his Falcon; that would seem to indicate the answer is an unqualified "Yes!"

Yes, that's exactly the problem. I think it's not gonna be that difficult to make Van Jacobson compression and PPP work. The trouble is that there is so much else, with higher priority, in STiK to be worked on. BTW.: The source code for Van Jacobson compression (i.e. CSLIP) is published in RFC 1144. It still needs to be integrated into the STiK environment.

One thing I haven't found out yet : Can somebody point me to where the usually used framing protocol for PPP is documented ? The RFC 1661 on PPP explicitly excludes the framing protocol specification.

Cheers Peter

Hi!
I have a 520STFM too with a memory expansion board fitted that gives me
2.5 megs of RAM. I would want to get 4. I have 2 slots free and I tried
to plug in two additionnal 1 meg PC simms but it didn't work.
Is there a modification to the circuit/connections that has to be done?
Does the ST automatically detects and configure itself to the new RAM?
I know that my board can accomodate 4 megs; I had paid extra (dearly at
the time) for that expandability. Now I can get the RAM for pennies but
I don't want to pay for a technician to do the work.

Thank you for your help.

I'm running Linux on a TT using a SOCOS SVGA monitor and the rather wide
border shows as black for me. I don't know how or why. Just to let you
know it's possible.

If you can get another IP address from your ISP then that's certainly the way to go. With those "unused" addresses you can connect if the machine with the proper IP address can do IP masquerading. But you'd still have addressing problems, if you want to communicate from Intra- to Internet or vice versa. However, there is no TCP/IP stack for Ataris yet that can do this. But, who knows, maybe one day we'll build it into STiK ? ;-)

Interesting.
The Quantum site lists no 350MB SCSI hard drive under Pro.(and they say they
list all they're old drives also.)
Under Quantum Lightning they list one though,
and that one can have parity disabled??

Why is this, if it is true we all need to know why! What is missing from a
Falcon 030 that makes it a "half" 030?

Cheers.......Mark

Yes, you can use several "PC" type disk drives, and I believe that it's
just about impossible to get 720Kb (DD) any longer.
I've used a Sony HD (1.44Mb) drive for quite some time now, and it's been
working just fine, though in DD mode only.
I'm still having problems trying to figure out how to get it to work with
the ST in HD mode, but in any case, replacing the ST drive with a new one
to get a working DD drive is no problem.

And by using this particular drive I was able to use the same Atari-styled
front panel and "eject-button" as before, only by modifying (slightly) the
mechanics of the drive etc.
I made a file with all the info about this which can be readily downloaded
for anyone who's interested:

ftp://ftp.sn.no/user/hallvart/atari/info/sony_144.zip (122 Kbytes)

Well, if it's just a matter of de-soldering a jumper there should be no
problems.
So these drives ordered from Quantum by Apple are a little different than
the usual "Lightning" drives then?
With my existing Lightning drive there's a jumper to enable or disable
parity. I'm using it with a Link II though, and I've never tried it with a
Link (I)...
I guess I should try before I buy.

228. Zip drive on Falcon (detecting)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-18 00:00:00 UTC
From: John Graser <johngr@teleport.com>
Message-ID: <01bc0564$ddc86ea0$ae7ba3ce@johngras>
Source record: 18409

I recently purchased a Zip drive for my Falcon. I have partioned it with HDX.prg Version 5.02 with 4 equal 24 MEG partitions. How do I have the Falcon detect it when booting since it is looking for SCSI 0. The drive is set to ID # 5 with termination turn on. This is the only drive other then the internal IDE 84MB. Which software that comes with the Falcon will allow me to have it reconize ID's after #0 with only one drive.

229. Re: Quantum LT harddisk with "ICD Link (I)"?

I am not convinced that you can't use a Quantum Lightning in a MSTE -
mainly because that is exactly what I am doing. I have the 730 mB model
(I thought it was just 730 & 540 mB models).

As I remember it I disabled parity on the drive (remove 'EP' jumper)
when I moved it from my Falcon to the (PAK'd) MSTE.

However, the drive initially mentioned may be different if it is built
for Apple.

230. Speeding up a Falcon: Nova vs Afterburner?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-18 00:00:00 UTC
From: Oliver Skelton <skelton@gatwick.geoquest.slb.com>
Message-ID: <32E037D8.319A@gatwick.geoquest.slb.com>
Source record: 18411

I am wondering which is the most effective way to speed-up a Falcon.
The thing which makes it a slug is the bus (with graphics load).
Hence I run in 4 colour mode for much of the time with an expanded
(Blow-Up) screen resolution.
I hate having 40column mode when I switch to TrueColor

Seems the Nova cards are getting cheaper.
Do they offload a lot of the work from the bus and speed the machine up?
Do they vacate some RAM for screen memory (I suspect not)?
How compatible are they?
(I run serious applications:- in no particular order;
Connect/NeoDesk/Everest/Kandinsky/Imagecopy/Logic/NVDI4/Papyrus
Twist/Opus(Texel to come) etc. etc.
Can I have both Nemesis/Afterburner _and_ Nova?

Can I also add a Nova to a PAK'd MSTE?.. and would it be worthwhile?

And as ever with computers... what are the questions I am forgetting to
ask (through ignorance) :-)

The zip drive as far as I remember can ONLY be set up with SCSI ID 5 or 6. This would mean that no matter how small you broke down the zip drive that you will be unable to make it a boot drive. Since this is the case I would reformat the drive using a BGM partition and use the whole 96 megs or whatever it formats to. Why IO Mega decided to make it SCSI ID 5 or 6 only, who knows. Hope that this is of some help. My next addition to my Mega ST is a Jazz drive and the T-36 accelrator board. Ohhhh yeah I like the speed.

h> from Hard & Soft in Germany. It's called the "Mega clock" and came with
h> a small German manual describing the installment etc.

Interesting, I hadn't heard of this module before.

Installation etc sounds easy given enough headroom.

>> (g) I'm not sure that the millenium problem will/won't be an issue for
>> you; I'm not certain that the solution to your problem won't cause

h> working fine, but my dad (who also has an STe) is in need of a clock as
h> well (so he won't have to set the time each time he uses the machine),
h> and since the clock I got for mine isn't available any longer I'm
h> looking for another solution.

My reasoning was that if you were to go for the Dallas SmartWatch option, you
might find that it was incapable of dealing with time after the millenium
(only because it was originally intended for a PC).

As I've said and in reply to your other post, there _is_ software around for
the DS1216E module BTW, which can be yours via UUE as its PD.

Speak to 'ya later!

The Floppie disk and the hard disk have a single common chip they use. I have had mine go out and only the hard disk wouldn't boot or it would tell me that it had damanged data. Though my floppie drive worked fine. Wow is this the pitts or what. I have also seen this chip cause problems with both the hard disk and floppie. If you need me to look up the part number for the chip I would be more than happy to do this for you. My e-mail address is dwmoar@aol.com

Hope that this is of some help to you
Atari*Dave

This message from Dennis.Armstrong@jet.uk to All came in on a wing and a prayer...

Hi Dennis!

>> h> Does anyone have a circuit diagram for an *internal* clock that

>> This sounds like something a friend of mine was attempting, he had
>> problems obtaining software, perhaps you could help each other.

DA> The hardware is availiable from Dallas Semiconductor Inc. try the
DA> web address http://www.dalsemi.com/ the part is a DS1216F

Thanks for this info Dennis, I have a few progs that will set and read the time from one of these SmartWatch modules, however they appear to use the DS1216 *E* module.

Others who may be considering this project may like to check that there is sufficient headroom above the TOS ROM chips to allow the fitting of a substantial module under one chip, in many STs the PSU obstructs the area above.

DA> Smartwatch. An Application note 4 gives the various hardware
DA> options. The Application note 52 defines the registers and gives
DA> sample code in a pseudo code (looks like fortran) and 8051 Assembly
DA> lang.

With the right (and working) module there is software already available as I said.

Thanks for the response Dennis.

I had a similar problem before on my ST, where it would refuse to read
and format disks. It was like this for 2 weeks but then it suddenly
fixed itself after I had taken it apart and re-assembled it....

A bit drastic, but it worked!

Mark.

The biggest problem with the Atari Disk Drive is the head(s) get dirty or knocked out of alignment. Either of these can be taken care of thought. It really doesn't matter if you have a single sided drive or a double sided drive. Cleaning the head(s) are the same. Alignment is a much harder thing to do usally requireing and alignment disk. Me I use a o-scope and the alignment. Should it be more serious the drive could be replaced witha good quality 1.44 meg 3.5 drive. Even though you will only be able to format to 720K with it. If you do replace the drive I would recommend the Teac FD-55a

R>
R> Disabled.

Noting that there has been a posting of a small circuit to provide the parity bit for those drives that require it from non-parity aware host adaptors a while ago.

Speak to 'ya later!

247. Free MIDI program

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-19 00:00:00 UTC
From: Rolf Nilsson / RONI MUSIC <roni@mbox317.swipnet.se>
Message-ID: <32E177C8.7252@mbox317.swipnet.se>
Source record: 18428

Hello,

Roni Music Home Page offers free down load of the Sweet Sixteen MIDI
Sequencer for Windows and Atari computers.

Sweet Sixteen is a comprehensive and powerful MIDI sequencer for
PC/Windows and
Atari ST/STE range of computers.
Sweet Sixteen offers Piano Roll, List and Transform edit pages as well
as a
dedicated Mixer page you can use for your favourite synthesizer.

Two versions are available:
1. A demo version which is a complete version of Sweet Sixteen with all
file saving disabled.
2. A "lite" version which lets the user save files but certain other
functions are disabled.

Check it out at: http://home1.swipnet.se/~w-11396

In this case, the "intermediate" machine was running Linux.

This is probably because Linux uses a different colour palette to GEM.

250. ExtenDOS Pro problem

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-19 00:00:00 UTC
From: Martin.Byttebier@ping.be
Message-ID: <853671632_OASIS_@ping.be>
Source record: 18431
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've installed ExtenDOS Pro v2.4a and now it seems I have a problem.
With the most CD's the driver works but with one CD he refuse to open
one directory, The CD (Artworks professional) contains 5 main dirs. I
can open 4 of then but I can't open the fifth.
On my friend's Falcon with Metados the CD is fully readable, so I
suppose the CD itself is oke.
Also it seems the same if I use or not all my usual autoprogs and
acc's so I suppose that I haven't an autoprog or acc that cause the
problem.
I also tried the UNI_BDDS.DOS driver with no luck.
I've notice when I access the CD via a fileselector (Freedom) the name
of the dir I can't open is written in lowercase.
Trying to access the CD with Kobold 3 results give me the following
warning (free translation from German to English)
"the mediumparameters of drive P can't be read
it's possible you can read it in GEMDOS-MODE"
In GEMDOS-MODE I can open the CD but not the fifth dir.
I've installed ExtenDOS Pro on a TT030 4/16 with 19" monochrome
screen. I've NVDI 4 and I normally use Thing or Thing/N.AES

Yup, I know, and it's saved on my harddisk in case I need it for later.
But I'd prefer to run things "out of the box". I only do these things if
nothing else works. By the way, has anyone tried building the circuit and
used it with an ICD Link? Problems?

>A friend of mine needs to xfer some data from Atari 1040 3.5" 720k disks to
>IBM PC format.

Try pc_st: ftp://ftp.teleport.com/users/atari

The only difference in format between MS-DOS and the TOS desktop is a
few bytes in Sector 0. pc_st writes the "missing" bytes on an
Atari-formatted disk.

DO NOT EVER under any circumstances do this to a self-booting disjk
(usually commercial games). It will destroy the disk's self-boot
ability.

257. Where can I get Info on HW upgrades for 030

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-20 00:00:00 UTC
From: Brian Hutchinson <hutch@ena-east.ericsson.se>
Message-ID: <32E39294.2781E494@ena-east.ericsson.se>
Source record: 18245

I have a stock Falcon 030, 14M RAM.

I am interested in the various HW upgrades but am ignorant
of what they offer.

Where can I find information on the BlowUP FX, Afterburner 040
and other upgrades I have failed to mention here?

I'd also like to here from people who have these upgrades and
how happy they are with them.

I'm interested in speeding up the CPU, DSP and whatever is out
there for video upgrades.

Thanks,

Brian

John, I don't believe AHDI will boot from anything except SCSI ID #0 (or IDE
#0). I do have Doc Uwe Siemet's AHDICONF program, though, so we might try
to see if it's possible to boot from ID #5; or you could purchase HD Driver
(my preferred driver, just sent the order off today).

If you're more-or-less local to Portland, call me at 503-244-3908 some
evening and we can get together and see what's happening with your Zip.

not true I think.
If you use ICD, or HD Driver you can choose which partition to boot from.
I have different auto folders on 8 of my partitions(3 different SCSI id's)
and can decide what configuration to load depending on which drive
letter I press on bootup

I believe Uwe Seimet created a program to "patch" the Atari Hard driver(AHDI)
so that it would look for and acknowledge those other SCSI device you had
at whatever SCSI id you gave them. I've never used this program, but try:
ftp://ftp.cnam.fr/pub/Atari/Disk/ ahdiconf.zip
good luck.bonne chance

That's exactly the point. The Apple-branded drives have parity permanently enabled with a zero-ohm surface-mount resistor soldered to the controller board. It's not impossible to remove it - but it (1) voids any warranty that might be in effect and (2) is not recommended for anyone who is NOT a SMD solder technician. I wouldn't try it personally, and I'm pretty handy with a soldering iron.

It boggles my mind to think anyone would ever try that (_un_soldering two
surface mount pins for my AB040 was quite enough), but what do you mean is
different?

I'd say it's rather unlikely that there's anything non-standard about the
original chip if a normal 68EC030 boots.

>closely. So, is there a way to hack an '030 or an 'EC030 down to the

I can't imagine an EC working in a Falcon since TOS uses the MMU which
isn't available in that chip. That could very well cause the crash.
Are you sure you got the TT chip soldered in correctly?

>could any power user, even in 1992. Yeah, I know, that's what the

265. Re: Some questions about the TT030

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-20 00:00:00 UTC
From: Rob.Schafrick@taf.to.org
Message-ID: <459_9701210100@to.org>
Source record: 18253

It's seems as though the TT is very stubborn to change from white
to black. It simply refuses to, no matter what.
However, Warp9 uses the StacyBlack screensaver, so it is possible
to do it, but it seems that the people at Codehead and the
person who wrote ZeroX know how. v_setcolor is the function in
question (vset_color?)

Please let me know if you get it working.

Also, I think another way is to mess with the memory required to do
the inversion, since TT high and TT medium require more memory to
do it. I read this in one of my programming books...

Funny how it works on the MegaSTe though...

>which enables IBM PCs to w/r Atari 1040 disks :-(

As the ST's desktop doesn't format disk to 100% MSDOS compatibility I
recommend using Hcopy instead.
In addition to making proper MSDOS disks (yes- I've tried them on PCs and
Apple Macs) it's a LOT faster and better than the desktop copy/format.
You can download Hcopy from:

ftp://ftp.sn.no/user/hallvart/atari/hcopy17s.zip (53 Kbytes)

269. What will AlberTT do for a MegaSTe?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-20 00:00:00 UTC
From: cj439@FreeNet.Carleton.CA
Message-ID: <5bulov$9fp@freenet-news.carleton.ca>
Source record: 18440

I have an opportunity to buy an AlberTT card to use on my MegaSTe. Can someone explain to me what advantages it would bring, and what (other than cost & installation hassles) disadvantages might there be? (such as some software not working, or...)

Does it mean I would have an ST with VGA? Would it make Web Browsing (as if I could get CAB/STiK configured and working) more exciting?

Any hints, theories, speculations, or diatribes welcomed!

> If I use Howfast the results are totally different..

Different programs always yield different results. This is because the
way the programs test the transfer speed often differs substantially.
You must not compare results from different programs. Stick to one
program and compare the results.
For my own part I always use SCSITOOL to measure drive speed.

I guess you still have the original 0.5 meg installed. You can't just plug in two more simms & get 4 megs; you have to disable the 'old memory' first.

I'm not sure which revision of the ST you have, but the fix is easy.

If you have the Marpet Extra-ram board, then just find the RAS0, CAS0 & CAS1 resistors (not sure of the locations, but the values are 33 & 68 ohms).

They will be located near the MMU chip. You have to unsolder the end connected to the MMU & wire this to the +5 volts.

You really should know a bit of electronics if you want to do this yourself as you should trace the wiring to the chip pins to check your work.

If you have some other expansion board, sorry, I can't be more specific.

For a good idea of how memory is used in the ST, look at the various memory upgrade files on umich.

There is a program from Atari called HD-Patch which will let you configure
AHDI to recognise drives not in consecutive order starting at 0. You should
find it on one of the popular ftp sites (ftp.uni-kl.de, ftp.cnam.fr,
atari.archive.umich.edu...) or just search with archie.

273. Give your STFM stereo SOUND!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-20 00:00:00 UTC
From: ceebti@cee.hw.ac.uk
Message-ID: <E4B7Dz.4yo@cee.hw.ac.uk>
Source record: 18444

Hi.

I've just built myself a rather spiffing stereo sound addon for my
STFM.

If anyone else ones to try one heres how I did it.

1) Connect an 8bit DAC to the printer port.

2) Connect the PSG output (Via the monitor port) to the LEFT
channel of a hifi.

3) Connect the DAC output to the RIGHT channel of a hifi.

4) Boot up a tracker program (The version of TCB soundtracker for
the 'Monster Stereo Cartridge' works particularly well. Also, the tracker
program 'Digit' (st format demo version) supports dac+ psg output too!)

5) Sit back and enjoy stereo sound from your good ol' STFM.

NB If I ever get round to it a may I post up detailed circuit diagrams etc

Enjoy!

> (Blow-Up) screen resolution.
> I hate having 40column mode when I switch to TrueColor

Who doesn't?

> Seems the Nova cards are getting cheaper.

They are? How much?

> Do they offload a lot of the work from the bus and speed the machine up?

That depends enteirly on what you want to do and which programs you use.
GEM programs will be very fast indeed, but graphics intensive progams,
like animation players wont be much faster. The reason is simple. Using
GEM programs the graphics elements are usually build up of rectangles,
circles, lines etc. These will be very fast as the NOVA-VDI will translate
these into a format that the graphics card want. So you don't need to send
a complete "picture" to the screen, but just tell it what to do.

Scrolling as also fast as the graphics card can blit the screen much faster
than the computer does.

Running an animation is a completely different story. Here you need to
cram the whole picture down to the NOVA card through the old slow 16-bit
bus. I guess it will be a bit faster anyway, but not much.

Apex 3 will support the NOVA and will let you use 16, 24 and 32 bit highres
colour modes. Not to bad. It wont be much faster then 640x480 TC with the
Nemesis, but the extra res and colour depth can be worth it I guess.

:-)

> Do they vacate some RAM for screen memory (I suspect not)?

The only thing is that you can't have more than 4MB ST-RAM as it uses the
above adress space. With a AB040 you doesn't realy need more than 4MB of
ST-RAM anyway as you can have plenty of Fast-RAM. :-)

> How compatible are they?

I havn't used one my self, but I have heard that they are very compatible,
atleast with GEM-Programs and ofcourse soon to be released Apex 3. :-)

> (I run serious applications:- in no particular order;
> Connect/NeoDesk/Everest/Kandinsky/Imagecopy/Logic/NVDI4/Papyrus
> Twist/Opus(Texel to come) etc. etc.

I can't see that anyone of those wouldn't work.

> Can I have both Nemesis/Afterburner _and_ Nova?

You can but you need to have a fan blowing directly at the Mach64 card
of the Nova as it wasn't designed to run faster than 16MHz, but it can
be done.

> Can I also add a Nova to a PAK'd MSTE?.. and would it be worthwhile?

I have no idea. There are Novas for Falcon and TT. There is one card called
Phanter for the ST.

Hi, there is a prg that will patch your AHDI.sys file.
Atari Corp did this one.
It works fine. But honestly, you should go for a real driver, such as
Hddriver. It will give you more flexibility and power to your Zip
drive.
And in my opinion it is stupid to buy a super drive, and still have
the old ahdi driver, it is not for the 39 bucks that it will cost you.
I think it is weird to see people spending 500 bucks for a harddrive
but they can not spend 40 bucks for a decent driver
(decent=excellent),
Anyway, it wasn't meant for you. :) the zip drive is pretty cheap
anyway. :)
Bye. :)

278. Atari ST differences

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-21 00:00:00 UTC
From: "Thomas A. Sherman" <toms@microware.com>
Message-ID: <32E53AF1.5CA@microware.com>
Source record: 18259

Here comes a newbie question.

I'm sure this type of question has already been asked and I have tried to find the answer myself, but cannot seem to find the info on the web.

What are the diffences between all the Atari ST systems? When I was younger I remember playing around with the Atari 520ST (512KB), and then the 1040ST came out which had 1MB of memory. But what about the STF, STE, Mega and Falcon? Are they all compatable with one another? All 68K based? Furthermore, does anyone know of some good Atari ST web sites?

Thanks in advance,
Tom

279. MIME/Base 64 info

Name: mimelite
Product: library
Platform: ANSI C
Where:
ftp://oslonett.no/Software/MsDos/Kommunikasjon/Offline/mimelt20.zip
Author: Gisle Hannemyr <gisle@oslonett.no>
Comments:

[Gisle Hannemyr <gisle@oslonett.no> 20-May-1994]

"mimelite" is a simple, lightweight library written in ANSI C that supports the parsing of MIME headers and encoding/decoding of body parts, suitable for inclusion in offline-readers.

If you develop mail and newsreader software (user agents), you can link mimelite with your own program to make it support a significant subset of MIME (namely the Content-Transfer-Encodings 7BIT, 8BIT, BASE64 and QUOTED-PRINTABLE). mimelite also supports conversion between the ISO Latin 1 character set used for European character sets on USENET/Internet and PC-based character sets (e.g. Macintosh, IBM CP-437 and CP-850).

The distribution archive also contains UNMIME, a standalone program to decode MIMEd messages encoded with BASE64 or QUOTED-PRINTABLE encoding.

The mimelite library is general enough to work in a number of contexts, but it has been designed to work well on MS-DOS (where memory is a scarce resource). Its main application is intended to help extend MS-DOS-based "offline-readers" for RFC-822 and RFC-1036 conformant messages to also support RFC-1521 and RFC-1522.

Olly Betts (Archimedes)
Comments:

[John Gardiner Myers <jgm+@cmu.edu> 16-Feb-1995]

Mpack is a minimal implementation of MIME, designed for encoding
and
decoding binary files in MIME messages. In short, it is the MIME
equivalent of uuencode and uudecode. For backwards compatibility,
it can also decode messages in split-uuencoded format. The
Macintosh
port can also handle AppleSingle, AppleDouble, and BinHex.

Starting with version 1.5, all official mpack distributions are
PGP signed by "John Gardiner Myers <jgm+@cmu.edu>". The PGP
signatures are detached from the distributions themselves, in
files with the ".asc" filename extension.

[Arjan van der Meer <arjanvdm@htsa.hva.nl> 30-Jan-1995]

There is now a version of mpack/munpack for the Atari ST and
compatibles. It is just a compiled version of the UNIX 1.2 version,
but what I've tried worked okay. It is made by
alex@hal.rhein-main.de.

>sites?

Other than the amount of RAM, the 520ST and 1040ST are virtually identical. Adding either an "F" or an "M" (or both) to the model number indicates an internal "f"loppy drive, a "m"odulator, or both (thus, the 1040STfm has 1 meg RAM and an internal floppy drive, and a modulator for use with a TV set). There was also a limited run of 260STs sold in Europe, with 256k RAM. The 260, 520, and 1040 were delivered with TOS 0.98 on floppy for the very earliest 260s and 520s, and TOS 1.0 or 1.04 on ROM in later models.

The Mega ST is a two-piece unit with an internal DMA port, an internal expansion bus called the "Mega bus", a blitter chip (dedicated pixel block movement processor), and a really nice detached keyboard. It was made in 1, 2, and 4 meg RAM models. Upgrading the RAM on the 2 meg model is tedious but trivial, if you can get the chips. The Mega almost always had TOS 1.02 on ROM.

The STe is almost identical to the STfm in appearance, but uses SIMMs for RAM, and has DMA setero sound and an enhanced color palette (4096 colors vs. the old 512 colors). It was delivered with TOS 1.60 and 1.62, and 2.05 or 2.06 can be easily installed in most STes (although not all have large enough sockets and will require new ROM sockets for a ROM upgrade). TOS versions from 1.6 on support only 512k, 1 meg, 2 meg, and 4 meg configurations (in the ST and STe). The 2.5 meg configuration was dropped, although some pathces exist that are supposed to fix this.

The Mega STe had a "wedding cake" style case with internal floppy and a bay for an internal hard drive, and a VME expansion port, plus 2 additional

(faster) serial ports and an Appletalk-compatible LAN port in addition to all of the STe enhancements. Some models were delivered with 720k floppies, but many had 1.44mb high density drives. The CPU has 3 speeds: 8 MHz/no chace, 16MHz/no cache, and 16MHz/cache, which makes it from 1.5 to 2 times as fast as a stock STe (depending on the operation being performed), plus a blitter. It also had the external keyboard, which moved the mouse and joystick ports to the ends of the keyboard case (they were underneath the Mega keyboard). Most MSTe models were delivered with either TOS 2.05 or 2.06 (there are rumours of other versions but I haven't been able to confirm any of them).

The TT030 is a 32MHz 68030-based system in the same style case as the MSTe, but in white rather than light grey. Sound is the same as the STe line, with the addition of an internal speaker (or "squeaker"). There are a total of 4 serial ports plus the LAN port, the usual ST ports (less the monitor port - more on that in a moment), and an external 25-pin SCSI port (plus the internal one). The TT requires a VGA monitor, or a very-high-rez monochrome monitor with a 15-pin high-density sub-D connector. On a VGA monitor, it can produce all 3 ST resolutions, plus TT low (320x480x256) and TT medium (640x480x16, or "standard VGA"). This is the fastest computer Atari ever produced, and several were purchased by NASA for use in designing the Space Shuttle and used in Denver, CO until recently (how many of you guys knew that?).

The Falcon030 is in a case similar to the 1040STe, and has (usually) an internal IDE hard drive of 65 or 85 megs, a DSP for audio (or any other purposes to which a programmer may wish to put it - processing JPEGs is one application of which I know), a 16MHz 68030 CPU, and 1, 4, or 14 megs of RAM (using Atari RAM boards you can't upgrade it yourself, but several third-party boards are available which use SIMMs). The actual RAM installed for a 14 msg Falcon is 16 megs, but the top 2 megs are reserved for system i/o and such. The Falcon also has a "processor direct" slot which is used by some PC emulator cards, and all of the usual STe ports except the DMA port - a SCSI-2 port was substituted there, putting the SLM-series laser printers out of work. The serial port is interesting in that, depending on how it is addressed, it can be limited to 19200 bps like the ST port, or go to 230k bps (although it's next to impossible to find a modem that can handle that speed). The Falcon also has the LAN port introduced on the MSTe and TT.

Hallvard's FAQ pages (referenced on my Web site) have vast amounts of information, but that's a quick overview.

Followups directed to comp.sys.atari.st

> 68K based? Furthermore, does anyone know of some good Atari ST web
> sites?
>

68000 / 8 mzh machines

520 ST 512K, External Floppy

1040ST 1024K, Internal Floppy (I think this model started as 360K
Floppy like SF354)

1040STF 1024K, Internal Floppy, Double Sided

1040STFM Same as above but with FM modulator in it.

Mega 2/4 68000 with blitter and 2 or 4 megs, even heard of a few 1 meg
models overseas (Europe)

1040STE 68000 with blitter and enhanced video (more colors to choose
from) and
better sound. Upgradeable by using standard 30 pin simms to 2
or 4 megs.

520STE Same as above, but came with only 512K to start, had to replace
all simms
to make a 4 meg machine I believe.

TT 68030/32 Mhz machine.. Finally got one myself, much faster, but
does
not like certain programs (GFA Written and complied).

Mega STE 68000/16 mzh Came in TT style case, with same specs as 1040STE
but newer TOS version (2.05/2.06) along with built in HD case.
Kit avail for upgrade if not ordered with HD.

Falcon 68030/16 Mhz machine.. Nice machine, just really a few years
to late.
Atari had lost too much support (for what little they ever
had) to clones.
And going back to a 16 mzh 68030 from a 32 mzh TT was stupid.
Then trying
to pack more video data thru it (True Color Graphics) on a 16

mzh bus.
Other's wished they would have released this with a seperate
keyboard/case
like the TT and Mega STe's had also. This comes in a 1040
Style case, but
darker gray.

Hope this helps explain things. E-mail if you have any more. Mike

I've got excellent techs and the proper equipment at my disposal. Now what _is_ crazy is swapping a surface-mount chip _3_ times. I'm really pushing it, which is why I want Motorola to test the next '030 to make sure it's good.

> I'd say it's rather unlikely that there's anything non-standard about the
> original chip if a normal 68EC030 boots.

According to Steve Cohen of Wizztronics, the Falcon CPU _is_ a true '030. Atari bought enough to get their own part number.

Steve's assessment exactly. I'm 99% sure the install was good. I think the '030 was bad.

> >could any power user, even in 1992. Yeah, I know, that's what the
> >expansion bus is for, but I'm already using the bus and would like an

True, but an accelerator on an accelerator makes no sense, and again, though the '040 accelerators are very nice, they're too darn expensive.

> Don't most of the expansion bus accelerators have a through-port?
>

> >inexpensive accelerator, not an $800 sub-computer.

Actually, Steve says the Hawk is still coming, at around $600. Keep your eyes open for www.wizztronics.com, they should be up and running soon.

283. Definitive word on EZFlyer & Atari TT?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-21 00:00:00 UTC
From: magee@cpsc.ucalgary.ca
Message-ID: <5c3b3f$e06@linux.cpsc.ucalgary.ca>
Source record: 18264

Hi all. I apologize in advance for what must be a recurring
theme here -- but I can never seem to find the messages in my
logs when I need them.

Q: Is anyone here using SYQuest EZFlyers on their Atari TTs,
from the external SCSI connector? If so, what troubles did you
have (adapters needed, software drivers etc). I have AHDI 6.061,
so I'd be specifically interested in knowing if the EZFlyer can
work 'out of the box' with this setup. The place I'm thinking of
buying from will *not* take it back if it doesn't work 'just
because my machine's not a PC or Mac'. (A common opinion of course --
the unit isn't defective if it works on PCs and Macs..)

I don't want to risk plunking down $380 Canadian before being
sure!
Thanks in advance,
-Russ Magee

(This stuff really needs to be in a FAQ?)

l> Is there a modification to the circuit/connections that has to be

Look on the motherboard, there should be two resistors that have been cut
free from the circuit board and their free ends connected to one end of a
large capacitor. You have to do the same for two more resistors.

My installation guide mentions several circuit references, pick pairs across
that match what you have presently:

Bank 1 Bank 2

R61/R60 R71/70
R90/91 R93/94
R68/70 R148/149

:
: Atari*Dave

Yeah...I once had a 1040 ST that wouldn't go over 2.5meg for anything,
despite having the correct MMU chip. I sent the thing all over the
country (at least 6 techs) trying to solve the problem...when finally
one of them offered a great trade in deal on a new STe. I was told
this was rare...and that the mother-board on this particular ST was
also rare...all the techs said it was the only one like it they'd ever
seen! I'd gotten the machine new in 1988 at a retail computer store
in Jackson, MS...dunno how many they stocked and sold exactly like it.

Good Luck,
Brian

No because TOS lacks a lot of the basic features needed for implementing
Java.

> AFIK there exists nothing for TOS, how about under linux?

Under Linux you can get Java running if you

1. Get the Java JDK sources from Sun (no fee for non-commercial use)
2. Apply the Linux patches to them and compile them
3. Make additional processor-related patches (a few lines of Java source
code are written in assembler language)
4. Get your hand on the Motif sources (unlikely). You need Motif for the
Java AWT.

Not for point #4. I have linux Slackware96 installed and it no longer contains or requires anything from Motif. It uses a Motif-alike that is sanctioned by the Free Software Foundation so Java is now able to run with a simple patch. Actually when I installed Linux Java was pre-installed when I installed the "N" disk set i believe!

>format the floppies might have been.

The format depends on which disk drive was used and which DOS formatted the disk, but in general, it will be 40 track, single or double sided depending on the drive), and 128, 256, or 512 bytes per sector (depending on both the drive and the DOS). It's relatively easy to read the format; making sense of the FAT is tougher but hardly impossible. My best suggestion would be to talk to the guys in comp.sys.atari.8-bit and get their take on it; several Atari 800-series to PC programs already exist.

Hi John,
Yes, AHDI can recognize SCSI devices with ANY ID, but it needs to be
patched. There are configuration bits in AHDI header which rule the way
AHDI works. But The AHDICONF program from Uwe Seimet only works with
AHDI versions up to 5.00.
There's a version of AHDI 6 configured for scanning all devices on both
IDE and SCSI bus, you can find it in some AHDI pack in a folder named
'MUNGED'. I think you should be able to find it somewhere on an ftp
site. If you don't, just send me an E-mail and I'll send it to you.
(I own both 6.06 and 6.061) munged versions).

I bought the drive and it works!!! ....with ICD's Link (I) as well as Link
II, so all is well.
The drive was just a regular Quantum Lightning 365S, and the jumpers were
just like on my own Lightning 540S, so I simply removed the "parity" jumper
(resulting in "parity=OFF) and bingo! the ICD software recognized it and I
was able to format and partition it.
No soldering or anything.

: not true I think.
: If you use ICD, or HD Driver you can choose which partition to boot from.
: I have different auto folders on 8 of my partitions(3 different SCSI id's)
: and can decide what configuration to load depending on which drive
: letter I press on bootup
true I think.
Your Accessories and AUTO-Folder-Programs may come from different
partitions, but the hard disk driver is always on drive 0 (and is
the program that lets you choose from where to read the auto folder ...).

Try to disconnect only the first harddrive and your system will NOT
boot from one of the other drives.

Ciao,
Till

As long as there's a driver installed, ICD Will let you boot from any physical drive and any partition. AHDI boots only from SCSI ID#0 (or #8 if you accept ICD's numbering scheme and you have a TT), or from IDE - UNLESS you reconfigure it using Uwe Siemet's AHDICONF.PRG - which, if you insist on using AHDI, I highly recommend. Personally, I have ordered HDdriver. The demo version is so much better than ICD (which, until now, was the best I had ever seen) that I scrimped on lunch money for a moneth so I could buy it.

Firstly, does the busy light come on when you try to access it as B: (I'm
assuming you aren't trying to connect it internally)?

If not, then change the DS jumper (it may be set as DOS0, and you wnat DS1,
or vice-versa - the PC and the ST are opposites in this respect).

If so, then make sure it doesn't have terminating resistors installed. The
ST doesn't need 'em.

304. B drive problem

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-25 00:00:00 UTC
From: please@no.spam.mail.here
Message-ID: <27390_please@no.spam.mail.here>
Source record: 18285

I'm hoping someone can help...

I've just bought a new Sony HDD drive mech to replace the B drive in my Lighthouse Tower case, which has a drive distribution board within to feed both the A drive and the B (and a third) drive. It uses the signal from pin 19 of the sound chip to switch drive access to drive B when requested, and I'm using it as a straight DD drive, ie 720K formatted capacity.

Now the problem is that whilst the Sony is quite happy when plugged into the B drive external DIN socket using a lead from a spare drive B setup, it is not recognised when plugged into the drive dist. board in the Lighthouse, which is quite happy with the original drive. The only difference that I can imagine making a difference is that the working B drive cable Shugart connector isn't fully populated.

I've rounded up the usual suspects, put the connector in the other way round etc, but nothing, yet it works if connected through the external socket.

Puzzled!

Regards, Derryck (email replies to DCroker@mettav.demon.co.uk if you like please)

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,abg.atari

Check out my Updated Atari Catalogs and find More Atari stuff! I've got Monitors for your Atari 8 Bit like Commodore CM-141 "Like the Commodore 1802" And Disk Drives for the Atari 8 Bit like Stock 1050 and a 1050 Duplicator Drive for Backing Up Software. Plus I've bought out the Game Cartridge Gorf for the 400 & 800 & the Educational Math Game Cartridge Space Journey for any Classic 8 Bit Atari Plus I've cornered the Market on New Copies of Print Shop and some Print Shop related Items! That's Gorf, Space Journey & Print Shop All New Copies, All for the Atari 8 Bit! Plus a Good number of SSI and Avalon Hill/MicroComputer Games, and Many of them are Complete. Plus some Flight Simulator II from SubLOGIC including Scenery Disks all for the Classic Atari 8 Bit. For the Atari ST & newer Computers I've added to my HardWare Catalog Supra Hard Drives, Spectre GCR Mac Emulators, Indus (Future) GTS-100X Disk Drives, Panasonic MultiSync Monitor that does Double Duty for both ST Color and MonoChrome Monitors and the Cable/Hardware to your ST Computer. I've also added Software to my ST Catalogs & revised my prices. Titles such as Brand New copies of Ultima V for those of you Ultima Collectors and for those who like Flight Simulators, theirs F-15 Strike Eagle, F-16 Combat Pilot, Falcon, Falcon extra Missions Disk, Fighter Bomber and Flight Simulator II. In Productivity Software, theirs Data Manager ST, Degas Elite, Easy Draw, MultiDesk, NeoDesk, Revolver & PageSTream. All for the ST.

See my Web Page at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. At BSC's Web Page you can View, Capture and even DownLoad Atari Catalogs or Contact BSC by Web Page! Or Request Catalogs by E-Mail. Do You Have problems connecting with BSC's web page? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Please let me know if I can't attach files to your E-Mail. I'll get back to you after the weekend. Catalogs are sent only by E-Mail. Not Snail (Postal) Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. >I am amazed and pleased. You don't suppose Apple finally figured out that
>charging extra for having the drives customized was hurting slaes, do you?
><G>

hehe... perhaps.
Oh- I forgot to mention that the drive was a "customized" disk!
That is- it looked and behaved just like a standard Quantum Lightning drive, but the label on top of it said "Apple computer Inc." in big letters, and "Firmware (c) 1994" which I assume means that the special code needed for the Apple harddisk utility software is in there- for some stupid reason the software looks around on the drive to see if it's an Apple drive or not, and if not you need to buy extra software to format it!!

When I formatted it on my Atari it said "Quantum Lightning 365" however, and "Quantum LT" was written in small letters on the abovementioned label on the unit.
Well, I'm glad it worked! My dad's going to be pleased when I finally get to install the harddisk for him (he's been using his STe without one for over 6 years and hasn't really seen the "power-user" side of the ST yet, still thinking that you need a PC to do "serious" work- I think this will make him change his mind ;-).

By the way, I'm going to install everything on my own system here, so it'll be ready with software and everything (PD/shareware ofcourse in case anyone thought about flaming me here ;-)
but since he's got a different TOS version than me, will he get problems when connecting it to his machine?

I'm using TOS 2.06 (UK) on my STe, while he's using TOS 1.62 (Denmark) on his STe (or is it 1.06 or 1.60???? whatever- it's the TOS that was installed in his STe when he got it).
When formatting/partitioning the drive using ICD's software/ICD Link there was an option for TOS versions there. It had something to do with compatibility, but I didn't really understand it. Something about being able to use bigger partitions with versions more recent than 1.02?

Does this just mean that setting this option to 1.02 instead of 2.06 (as it said when using my machine) will limit the partition sizes or something? Anything else I should know, so i don't get any nasty surprises when I bring the drive over to him?

309. Atari SM124 for sale

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-25 00:00:00 UTC
From: alweekes@audiophile.com
Message-ID: <32ea4c07.2698041@news.enterprise.net>
Source record: 18290

I have an Atari SM124 monochrome monitor for sale as I no longer require its services (replaced with multisync VGA).

Manufactured Sep. 1988, it is in excellent condition, and perfect working order.

Has been optimised for focus and to display the maximum possible resolution when using Autoswitch Overscan.

It is possible to see working, if you are local to me and wish to collect (Sevenoaks, Kent, United Kingdom), or email me and we can arrange carriage etc.

Offers by email to <alweekes@audiophile.com>

Happy Atari Computing.

310. Tos 2.06 images

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-25 00:00:00 UTC
From: alweekes@audiophile.com
Message-ID: <32ea4c3c.2751128@news.enterprise.net>
Source record: 18291

Having played with the demo version of Gemulator, using my copy of
Magic and Ease, I was duly impressed, but I have some compatibility
issues which I am certain (from previous experience) would be cured by
using TOS 2.06, which I have already installed into my ST.

Having contacted the author of the above software it was suggested
that I purchase the plug in PC card to use my existing ROM's, but I
have two problems with this:-

1. I've used all the ISA expansion slots in my PC - only PCI left
2. My original Atari won't work without it's ROM's!

As I am looking forward to being able to run some of my original
Atari software, but at considerably higher speed, and buying the full
version of Gemulator, I would be grateful if anyone could supply me
with details of producing a TOS disk image from my existing Atari
ROM's.

Thank you in advance,
Andrew.

Five quid says it's the usual DS0 vs. DS1 problem. If you connect it in
place of the A: drive, does it come up as B: ? (no, of course not, then you
don't have an A: so TOS doesn't see any floppies at all...) See if you can
find a PC dual-floppy ribbon cable with the "twist" in it, along with a
double-male 34-pin header (to link the PC cable in where the B: should
connect to your Lighthosue connector). Plug the Sony drive into the PC
cable (pic a connector - if one doesn't work, try the other one) and see if
it comes up that way. If yes, it's the DS switch/jumper. If no, it's
gremlins.

I'm pretty sure that TOS 1.62 has the same partition size limits as TOS 2.0x
(that is, 512 megs per partition), but you should ask Uwe Siemet to be
absolutely certain.

BTW< I tried to install CBHD on my TT last night - with results as awful as
you reported. However, rather than muck about with it for days, I just
reboot from a floppy and reinstalled AHDI - no problems. Now, as soon as HD
DRiver arrives... <fx: slavering dogs>

Body handling: Inline uuencoded payload not displayed: TOSDUMP.ZIP

The enclosed file should do it. It's from the unofficial STonX home page (http://www.users.fast.net/~smol/stonx.html). It's very slow, but you only have to use it once.
Also, it's possible to make your own image with something like GFA Basic. I did that myself a while back while trying STonX. Basically, you just do BSAVE once you figure out at what address your TOS ROMs are stored - I found out the address of mine with STINFO.PRG. Since no ST version of TOS is longer than 256K you'd issue a command like BSAVE "MAGIC_PC.OS", $E0000, $40000. That's assuming that your TOS starts at $E00000.

GEMulator should work with most versions of TOS although I had some problems with my TOS 1.62. Since the demo does not support for the Blitter, GEMulator crashed just before the desktop was about to appear. Nominating a replacement desktop by autoloading it the DESKTOP.INF file cured that. Seems the Atari STe desktop doesn't check whether a Blitter is present. (BTW, GEMulator looks for the DESKTOP.INF file in the folder from which it was started rather than the root of C.)

Hope that helps.

315. Can I replace the Atari ST disk drive with a PC disk drive??

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-26 00:00:00 UTC
From: kgoucher@indigo.ie
Message-ID: <32f17b6e.6636169@news.indigo.ie>
Source record: 18197

My Atari ST disk drive is busted and I have a spare PC disk dirve.
Does anyone know is it posible to replace one with the other.
I have tried it but the PC drive wont function properly. Do I need
to increase the power going to the drive or something.

This is a last resort as I can't get my hands on a replacement
atari drive.

Thanx in advance.

All:

I have a mint condition FaST Hard Drive with internal Link I
controller built in. Drive unit is a 'desktop' type case with one 105meg
Quantum drive installed. Room for additional SCSI drive. Comes with
driver software installed on drive and on diskette.

I want $150/best offer. Shipping not included. I live in N.
California, and would prefer to have you pick it up.

Hi Kieron !

Yes it works ! I only use 2 PC-Drives (but the 720kB-Drives !!!) and it works fine. If you take the PC-drives they are always jumpered as drive 1 (not 0) because on the pc they select drives with the cable that is crossed between the two drives.

Be sure to use 720kB drives !

Ciao
Peter

Providing the cable goes in the correct way and you set the PC drives
DS 0-3 jumpers for Drive A then it should work perfectly.

****
I received $197.00 dollars in the last four days
****
Hello! I've got some awesome news that I think you need to take two minutes to read if you have ever thought "How could I make some serious cash in a hurry???" , or been in serious debt, ready to do almost anything to get the money needed to pay off those bill collectors. So grab a snack, a warm cup of coffee, or a glass of your favorite beverage, get comfortable and listen to this interesting, exciting find!
Let me start by saying that I FINALLY FOUND IT! That's right!. I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes like multi-level marketing, mail-order schemes, envelope stuffing scams, 900 number scams... the list goes on forever. I have tried every darn get rich quick scheme out there over the past 12 years. I somehow got on mailing lists for people looking to make money (more like 'desperate stupid people who will try anything for money!'). Well, when I was a teenager, these claims to 'get me rich quick' sounded irresistible! I would shell out $14.95 here, $29.95 there, $24.95 here, and another $49.95 there. I had maxed out my new Circuit City Card AND my Visa...I was desperate for money!! So, I gave them all a chance but failed at every one of them! Maybe they worked for some people, but not for me. Eventually, I just tossed that JUNK MAIL in the trash when I got the mail. I recognized it right away. I can smell a money scam from a mile away these days, SO I THOUGHT....
I thought I could sniff out a scam easily. WAS I WRONG!! ....I LOVE THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating to GET CASH FAST!! I thought..."Here on the Internet?? Well, I'll just have to see what schemes could possibly be on the internet." The article described a way to MAIL A ONE DOLLAR BILL TO ONLY FIVE PEOPLE AND MAKE $50, 0000 IN CASH WITHIN 4 WEEKS! Well, the more I thought about it, the more I became very curious. Why? Because of the way it worked AND BECAUSE IT WOULD ONLY COST ME FIVE DOLLARS (AND FIVE STAMPS), THAT'S ALL I EVER PAY....EVER!!

Ok, so the $50,000 in cash was maybe an tough amount to reach, but it was possible. I knew that I could at least get a return of $1,000 or so. So I did it!! As per the instructions in the article, I mailed out ('snail mail'for you e-mail fanatics) a single dollar bill to each of the five people on the list that was contained in the article. I included a small note, with the dollar, that stated "Please Add Me To Your List." I then removed the first position name of the five names listed and moved everyone up one position, and I put my name in

position five of the list. This is how the money starts rolling in! I then took this revised article now with my name on the list and REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN BOARD MESSAGE AREAS THAT I KNEW. I then waited to watch the money come in...prepared to maybe receive about $1000 to $1500 in cash or so.... But what a welcome surprise when those envelopes kept coming in!!! I knew what they were as soon as I saw the return addresses from people all over the world-Most from the U.S., but some from Canada, even some from Australia! I tell you, THAT WAS EXCITING!! So how much did I get in total return? $1000? $5000? Not even!!! I received a total of $23,343!!! I couldn't believe it!!

I now have a brand new black Acura Integra to speak for, due to this!! Now after almost 8 months, I am ready to do it again!!! So maybe it was possible to get $50,000 in cash, I don't know, but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You must follow through and repost this article everywhere you can think of! The more postings you achieve will determine how much cash will arrive in your very own mailbox!! It's just too easy to pass up!!!

Let's review the reasons why you should do this: The only cost factors are for the five stamps, the 5 envelopes and the 5 one dollar bills that you send out to the listed names by snail mail (US Postal Service Mail). Then just simply repost the article (WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you can. Then sit back and, (ironically), enjoy walking (you can run if you like! :o) down your driveway to your mailbox and scoop up your rewards!! We all have five dollars to put into such an easy effortless investment with SPECTACULAR REALISTIC RETURNS OF $15,000 to $25,000 in about 3-5 weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR TODAY,EAT AT HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND INVEST FIVE DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM NOW!!! YOU CAN'T LOSE!!

So how do you do it exactly, you ask? I have carefully provided the mostdetailed, yet straightforward instructions on how to easily get this underway and get your cash on its way. SO, ARE YOU READY TO MAKE SOME CASH!!!?? HERE WE GO!!!

*** THE LIST OF NAMES IS AT THE END OF THIS ARTICLE. ***

OK, Read this carefully. Get a printout of this information, if you like, so you can easily refer to it as often as needed.

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following: "Please add my name to your list". This creates a service out of this money making system and thus making it completely legal. You are not just randomly sending a dollar to someone, you are paying one dollar for a legitimate service. Make sure you include your name and address. I assure you that, again, this is completely legal! For a neat little twist, also write what slot their name was in: "You were

in slot 3", Just to add a little fun! This is all about having fun and making money at the same time!

2. Now fold this sheet of paper around a dollar bill ,(no checks or money orders), and put them into an envelope and send it on its way to the five people listed. The folding of the paper around the bill will insure its arrival to its recipient. THIS STEP IS IMPORTANT!!

3. Now listen carefully, here's where you get YOUR MONEY COMING TO YOUR MAILBOX. Look at the list of five people; remove the first name from position one and move everyone on the list up slot one on the list. Position 2 name will now move to the position 1 slot , position 3 will now become position 2, 4 will be be 3, 5 wil be 4. Now put your name, address, zipcode AND COUNTRY in position 5, the bottom position on the list.

4. Now upload this updated file to as many newsgroups and local bulletin boards' message areas & file section as possible. Give a catchy description of the file so it gets noticed!! Such as: "NEED FAST CASH?, HERE IT IS!" or "NEED CASH TO PAY OFF YOUR DEBTS??", etc. And the more uploads, the more money you will make, and of course, the more money the others on the list will make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST AND BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE & AMAZING SYSTEM!!! You'll reap the benefits, believe me!!! Set a goal for the number of total uploads you'll post, such as 15-20 postings or more! Always have a goal in mind!!! If you can UUE encode the file when uploading, that will make it easier for the people to receive it and have it downloaded to their hard drive. That way they get a copy of the article right on their computer without hassles of viewing and then saving the article from the File menu. Don't alter the file type, leave it as an MS-DOS Text file. The best test is to be able to view this file using Microsoft's Notepad for Windows 3.x or WordPad for Windows '95. If the margins look right without making the screen slide left or right when at the ends of the sentences, you're in business!

5. If you need help uploading, simply ask the sysop of the BBS, or "POST" a message on a newsgroup asking how to post a file, tell them who your Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try to describe how to do it but there are simply too many internet software packages with slightly different yet relatively simple ways to post or upload a file. Just ask for help or look in the help section for 'posting'. I do know that for GNN, you simply select 'POST' then enter a catchy description under the subject box, choose 'ATTACH', selecting 'UUE' and NOT 'TXT', then choose 'Browse' to go look for the file. Find your text file CASH.TXT and click on it and choose 'OK'. Place a one line statement in the main body section of the message post screen. Something like "Download this to read how to get cash arriving in your mailbox with no paybacks!" or whatever. Just make sure it represents its true feasibility, NOT something like..."Get one million dollars flooding in your mailbox in two days!"

You'll never get ANY responses!

6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE CASH IS ON ITS THE WAY!! Expect to see a little money start to trickle in around 2 weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!! All you have to do is take it out of the mailbox and try not to scream too loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

7. So go PAY OFF YOUR BILLS AND DEBTS and then get that something special you always wanted or buy that special person in your life (or the one you want in your life) a gift they'll never forget. ENJOY LIFE!

8. Now when you get low on this money supply, simply re-activate this file again; Reposting it in the old places where you originally posted and possibly some new places you now know of. Don't ever lose this file, always keep a copy at your reach for when you ever need cash. THIS IS AN INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN CASH IS NEEDED!

Actually that doesn't matter. If you don't have a high-density controller,
the drives will act like 720k drives even if you get 1.44mb drives (which
are quite a bit easier to find, of course).

: ATB, Frank.

OK, I am giving you the reason:
I have a PAK3 68020 accelerator in my MegaST with a French TOS 2.06. I have the opportunity to put more memory with an expansion card (FRAK020) but the reseller told me that I would need a TOS 3.06. AS this FRAK card costs more than 200 DM, I just want to be sure that my accelerator card is supported by TOS 3.06.
That's it !!!

BTW, AIXIT Gmbh (http://www.aixit.com) sells a memory expansion card that goes beyond the 4Mb barrier on ANY STfm thus allowing a maximum of 14Mb of memory and for a fairly small price (around 200DM)

Sure, you can use a "standard" high density 3.5" disk drive, but in order
to use it with HD disks you need to add an extra circuit board to your
computer and probably change the disk controller chip.
I've successfully been using a HD disk drive for some time now, though I'm
still working on how to make it work in HD mode, but apparently you don't
need to worry about this if you just want to "replace" your existing drive.

Download a file I made with all the information needed for the replacement:

ftp://ftp.sn.no/user/hallvart/atari/info/sony_144.zip (22 Kbytes)

Good luck!

In case anyone else is interested...

I've discovered it is possible to read PC formatted SCSI disks using
HD-DRIVER 6 and BIGDOS.

Sure about that? As I recall, on a real ST, that won't work. You have to copy
the ROM into RAM and save it from there. Saving direct from the ROM are gives
you a file full of zeros.

And why post a binary when you can post the URL?

Forgive the context mismatch, but I don't know where else to ask...

Does anyone know where to get Pin-Out information for the expansion port
of the Atari 7800 Video Games Console? I would like to build a Composite
video cable (audio/Video or Chroma/Luma Video) for it if this is available
at that port.
Please respond by E-mail!
Thanks!

Lenkel@inconnect.com Paul Luscher
Pick up the NEW CD from Site51 and LENKEL called: PROJECTILE
featuring Seven bands from Salt Lake City proper, "Bubble Couch",
"Mirror Mirror", "South", "Aeon Dawn", "Insanity Void", "Poink", and

Amazing - I've been using CBHD on my MegaSTe since version 4.55 - no
major problems. I started using it because ICD wouldn't run with
Magic. Then CBHD 5.01 wouldn't run Magic anymore, but on installing
CBHD 5.02, no probs at all!!

-----BEGIN PGP SIGNED MESSAGE-----

Hi all,

I'm working on a possible article at the moment about the TT, and I have
no pics of the damned machine :)

Does anyone have any images in any of the usual formats (GIF, JPEG etc.)
of any part of the TT - interior motherboard shots, exterior shots,
whatever? I'm after anything I can get - if anyone has any existing web
resources or ftp links to TT info, it would be appreciated too.

If you can help, please either upload via ftp to
ftp.demon.co.uk/pub/atari/incoming/ along with a little note, or email
the images to me at frank@tachyon.co.uk, please.

Thanks in advance for any help ;-)

ATB, Frank.

Depending on the type of CD-Writer, and how long/often you'll have use of it
you might want to consider using the CD-Writer on your Atari!
from: http://www.iarelative.com/cdserv.htm
Formats supported with CD-Recorder 1.0
CD-ROM, CD-ROM Multi-session, CD-DA (digital audio CD), Mixed Mode CD-ROM
Recorders supported with CD-Recorder 1.0
Philips, Kodak, Ricoh, JVC
System requirements for CD-Recorder 1.0
Falcon or TT or compatible, 4 meg of ram (additional ram suggested), 2 gig of hard disk space
Great for use with Cubase Audio Falcon! Store your digital audio files in an easy to access format and create pre-master in you studio for Red Book Audio CD
Free up your hard disk by storing data on easily accessible CD ROM format
Published by the Masters of Atari CD ROM, CD-Service of Germany

regarding interchanging SCSI disks between IBM and Atari
it should be OK with HD Driver , but there may be a 32MB limit??
best to ask Uwe here.

You might want to contact both John Hardie jhardie@pipeline.com and more importantly Keita Iido keita@mindspring.com They both run Atari Gamming Headquarters and may have the technical data files for the Atari 7800. I thought at one point I had that information and it may have gotten lost in the shuffle one day and now its gone.

> Does anyone know if there exists a way to run Java applets on
> a TOS machine?

u > No because TOS lacks a lot of the basic features needed for
u > implementing Java.

Actually, one could create a virtual machine emulator and "execute"
the program within. In fact, one can implement ANY language that
way, whether it was intended to be platform independent or not.

But since the platform required for JAVA closely resembles UNIX,
most of the work is done by the LINIX package itself.

Machine independent software: software which doesn't run on ANY
machine.

Hi,

For anyone who has been having trouble with ZetNet and OASIS/ICE,here
is an example of what your ICE.NET file dial script section should look like

This is based on a partially constructed dial script sent to me by
Colin Fisher-McAllum. I logged on and downloaded 300 news articles with a
tansfer rate of over 1100 bytes per second with this script.

TTFN

```
'
$! DIAL START
'
' Zetnet
'
0:DIAL_TIME = 30
'
0:CONNECT_TIME = 60
'
0:DELAY_TIME = 0
'
0:PHONE = 0345573793
'
0:PACKET_CLEAR = OFF
'
0:r- *&Gx(&dDEa
0:s- ZETslip
'
0:r- Name
0:s- 'your name goes here'
'
0:r- Number
0:s- 'your three segment number goes here'
'
0:r- IGNORE
0:s- 'your other eight digit number goes here'
'
0:r- IGNORE
0:s- 'your password goes here'
'
0:r- SLIP
0:s- IGNORE
'
```

```
0:r- RESS
0:s- $GET_IP
'
$! END DIAL
'

Source record: 18224
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi you all:

I was -probably- messing with the assign.sys file. Now Paryrus
doesn't want to print; it reports:

Gdos driver MEMORY.SYS not found
It should be present in the "ASSIGN.SYS"
file with the device # 61

When I boot, I can see that MEMORY.SYS is loaded. I run NVDI. My
ASSIGN.SYS includes the device #61

PATH = C:\DRIVERS
1P SCREEN.SYS
2P SCREEN.SYS
3P SCREEN.SYS
4P SCREEN.SYS
5P SCREEN.SYS
6P SCREEN.SYS
7P SCREEN.SYS
8P SCREEN.SYS
9P SCREEN.SYS
10P SCREEN.SYS
21 FX80.SYS
31 META.SYS
61 MEMORY.SYS

What's wrong with it? Could you check yours please? Atari Works
doesn't have any problem printing, and it uses all the fonts that papyrus
uses. I have MEMORY.SYS and the same ASSIGN.SYS in 3 places
C:\
C:\DRIVERS;
C:\GDOS.
Nothing happens :(.

I wouldn't call this a discovery but a well documented feature of these
software packages :).
BTW, with HDDRIVER 6 and MagiC 5 instead of Big-DOS PC disks are also
supported. Because MagiC 5 supports long filenames compatible to Windows
you even get a higher degree of PC compatibility.

I thought we were talking about something that makes sense in the real
world. How slow do you want Java to be if it is executed on a virtual
machine? It's not that fast even without emulation.

349. GEMulator FAQ in the making

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-29 00:00:00 UTC
From: cronos@worldaccess.nl
Message-ID: <N.012997.111705.97@wxs4-8.worldaccess.nl>
Source record: 18230

Hi there, and sorry for the cross-posting...

GEMulator is an Atari ST emulator for PCs. The creation of a newsgroup is in the making, although limited to a planning stage at the moment. I am currently setting up a FAQ file, and I would like to request everyone who has fixed any of the problems he ran into to write them down (including their solutions) and mail me at my private email address. It looks like the first version of the FAQ will primarily be questions (so you're welcome to ask questions that you don't know the answers to, too), but I'm sure we'll get there in the end.
If you want to be put on the GEMulator FAQ mailing list, please email me with a subject of "sub GEMulator FAQ list".

If you want to have a look at some of the problems *I* am having with the GEMulator...

1) "ST Zip" won't work. It cannot write (deflate) anything; it gets write errors on the hard disk. Can this be fixed?

2) Can "FastCopy Pro" be made to work? I tried to copy a disk (this had readable directories and folders) and, although FCopy appeared to work fine (albeit slow when writing) the target disk had 0 bytes used, and no folders either.

3) "Revenge Doc Displayer" refuses to be installed properly. How come?

4) "Freedom" seems not to work; the file selector seems unable to let you save a document that already exists, although it does update the time stamp.

5) "Xboot" sees folders double and can't find its own "c:\XBOOT\" path. Suggestions?

6) "Ledpanel" doesn't work.

7) I tried installing Geneva and Neodesk 4 on the GEMulator. Neo4 seems to work just fine. Installing Geneva goes fairly OK, but it can't use Neo4 at the same time. I think the problem is the following: To autoboot Neo4 from Geneva (as a shell), Geneva has to read the specs from GEM.CNF. And the GEM.CNF is always 0 bytes after installing it on GEMulator...

8) The GfA Basic compiler "MENU.PRG" screws up compiling. I fixed this problem...a solution will be in the FAQ.

9) A failsafe way to check the write-protect status (on any Atari, any TOS version) won't work on GEMulator. How can one check this now?

That's it...I hope there'll be lots of response.

Well, I didn't have info on AVR on my WWW pages, but the info is now there.
There is also info on playing samples with the falcon OS calls, or via the
WavePlay function (needs SAM).

Cheers for the plug. :)

BTW. I have just re-organised the programming section to make it easier to
find info (classified into graphics, sound, gem, and misc routines).

Hi Frank,

I have a copy of Issue 44 of ST World dated Oct 1989. On the
cover is a generated image of the TT's unvailing. Within the
article are a couple of nice pics from a Dusseldorf show.

While digging I also found a pic of PGA 030 Falcon in
Atari Advantage, Oct 1992 and a cover shot of Atari
Explorer with the Portfolio in the "Terminator 2" theam.

I'll have to scan them tomorrow. Look for them Friday at
ftp.ridgecrest.ca.us/pub/users/m/mgrove in the pics dir.

: >the program that lets you choose from where to read the auto folder ...).
: >
: >Try to disconnect only the first harddrive and your system will NOT
: >boot from one of the other drives.

: As long as there's a driver installed, ICD Will let you boot from any
: physical drive and any partition. AHDI boots only from SCSI ID#0 (or #8 if
: you accept ICD's numbering scheme and you have a TT), or from IDE - UNLESS
: you reconfigure it using Uwe Siemet's AHDICONF.PRG - which, if you insist on
: using AHDI, I highly recommend. Personally, I have ordered HDdriver. The
: demo version is so much better than ICD (which, until now, was the best I
: had ever seen) that I scrimped on lunch money for a moneth so I could buy
: it.

The driver is loaded by the TOS and AFAIK TOS only recognize a drive with
SCSI #0 (to be precise with ACSI number equal to 0). So if you want to autoboot
from the hard-disk, this one MUST be set to SCSI 0 or you will have to boot
the driver from the floppy disk!

I have booted from SCSI ID#3 and from #4 without having an ID #0 physcially
present. AHDI probably won't do that, but ICD definitely will.

Message-ID: <27874_please@no.spam.mail.here>
Source record: 18147

A comment to my original message:

p> Now the problem is that whilst the Sony is quite happy when plugged
p> into the B drive external DIN socket using a lead from a spare drive B
p> setup, it is not recognised when plugged into the drive dist. board in
p> the Lighthouse, which is quite happy with the original drive. The only

I've now got this working, the drive select lines on the drive for devices 2
and 3 (pins 14 and 6) need grounding to the adjacent grounds on the odd
numbered pins of the connector on the drive. I have also cut the matching
wires in the ribbon cable, and also unused lines from pins 2,4 and 34.

Regards, Derryck

This message from Rich to All came in on a wing and a prayer...

Hi Rich!

RT> See if you can find a PC dual-floppy ribbon cable with the "twist" in
RT> it, along with a double-male 34-pin header (to link the PC cable in
RT> where the B: should connect to your Lighthosue connector). Plug the
RT> Sony drive into the PC cable (pic a connector - if one doesn't work,
RT> try the other one) and see if it comes up that way. If yes, it's the
RT> DS switch/jumper. If no, it's gremlins.

The drive is set to DS0, but have it working now (see my other post). I also noted (once I'd got the metal shielding off the bottom of the drive) that there was a zero-ohm resistor jumpering the drive as A, is that what the twisted cable you refer to change?

One thing tho', the Atari desktop (TOS1.4) won't format the disk at the first attempt, need to click on the Retry button on the error alert that appears at the first attempt, progs like Kobold and Fastcopy don't have any problems tho'. Wierd.

Thanks for your input Rich, these things are something of a black art! (g)

Speak to 'ya later!

363. Help w/PPPkit

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-30 00:00:00 UTC
From: caesar@nwlink.com
Message-ID: <5cqlj6$l71$1@texas.nwlink.com>
Source record: 18150

Hi there. Me again.

First of all, thanks for all your help so far.

So, here's the deal: I've got 10 days of free PPP to try and get Mintnet to work with CAB. I think I'm pretty close and, probably, missing something pretty obvious.

I, following the advice given previously, created a new folder, "TMP," on my MintNet partitition (quasi-partition). I still get the "Path not Found; error #-34," though, when trying to access a URL with CAB.

Now, I believe that I am getting a PPP connection. Here's my recent MESSAGES:

```
Failed to create pid file /var/run/ppp0.pid: file not found
<29>Jan 23 14:09:50 pppd[7]: Connect: ppp0 <--> /dev/modem1
Jan 23 14:09:52 homer pppd[7]: local IP address 100.0.0.1
<29>Jan 23 14:09:52 pppd[7]: remote IP address 204.96.82.86
Jan 23 14:10:26 homer pppd[7]:CCP: timeout sending Config-Requests
Jan 23 14:16:38 homer syslogd:
exiting on signal 15
```

I am intrigued by the "CCP: timeout sending Config-Requests." This, on the surface does not seem to be a "good" message. Is this a clue to where my problem lays?

Puhleeeeeeze help if you can! Only a week left!

Thanks,

Joel

364. Complete Canon P133 Computer System at Closout Price

We have the following Pentium Computer for sale.

Manufactuer: Canon

Specification:

Pentium 133 CPU
1.6 Gig Hard Drive
1.44 Floppy Drive
8X CD-Rom
28.8 Bps Modem
16MB of EDO Ram 72 Pin
Mid Tower with open 3 open 5.25 bays and 1 3.5 open bay
Case also has RF Connector
Intel Chipset Motherboard
16 bit Sound Card
1 MB PCI VGA Exp. to 2 MB
256k Pipeline Cache
PS/2 Keyboad and PS/2 Mouse
Windows 95

All computers are brand new from Manufactuer.

Price: $ 1,099 USD

Optional:

2 X 4 CD Recorder (Internal)
w/SCSI Card, EZ CD Pro Software
Price: 399.95 USD

Expand to 2MB of VGA Graphics
Price: $ 49 USD

Monitors Avilable Upon Request

If you have any questions feel free to call,
Please leave a message and your call will be returned promptly.

Yep. IBM and ATari disagreed on how to count from A: to B: (but then, what
did they ever agree on?). <G>

Probably a step-rate problem. Try a longer rate (you're probably at 3ms,
try 6).

>Thanks for your input Rich, these things are something of a black art! (g)

Never let it be said that I failed to practice the Black Arts...

Hi guys,

Looking for sound format? I found some interesting stuff that may be useful
for you all. It proved useful for my DMA sample player. Look at

http://www.cs.ruu.nl/wais/html/na-dir/audio-fmts/.html

AJ, maybe you should have this link in your page?

Look at:

http://www.geocities.com/SiliconValley/6880/phsw.html

for my DMA sample player.

HTH

if you could tell me where the file is, I would appreciate it. I have a
standard 520 ST and a Mega ST, both of which could use a boost speed wise.
I tried installing a 16 Mhz processor inside a 520 and
A: I discovered the solder in the motherboard is not eager to come out.
B: The processor I was using just didn' work :(so I ruined that computer.
But if the processor can handle overclocking, I would definately want to
try it. Do you know abot the ET4000 upgrade for the Mega ST? If so, could
you help me with it somehow as I would liketo try it.
Thanks alot.

50+ pics of TRACI LORDS, yes! ***6 Celeb CDs in One!***
50+ pics of Daisy Fuentes, hot spanish VJ
50+ pics of Salma Hayek, sexy latina actress! order now
50+ pics of Teri Hatcher 1-757-686-1271
* 4000+ pics of other NUDE stars
* 4000+ pics of PG-13 rated celebrity poses
* 10,000+ pictures total, thats TEN thousand!
* Graphics viewing software for Windows3.1/DOS/Win95
* CD is BBS ready, with descriptions of files! And its Mac readable!
* Many more features and pictures of stars!
* NO AMATURE MODELS! - ONLY Celebs!

(Orders call 757-686-1271)

Other information:
* Packed in white shipper: No signs of nudity (Wife protection plan!)
* There are over 10,000, that's TEN THOUSAND FILES, on ME#3 alone!
* All pictures are high quality at least 640x480!
* Directories are arranged in NUDE/NON NUDE format for easy use!
* Graphics viewing software for Windows/DOS/Win95
* CD Is ISO-9660 Macintosh compatible if you have a Mac JPG viewer

* It's truly BBS-ready with detailed descriptions of all files!
* ME#3 will save you -ALOT- of download/searching TIME & MONEY!
* Sysops! Has a files.bbs conversion program for different formats!
* Many more features.. Guaranteed or your money back!

This CD represents high quality work. Here is the pricing:
$$$ $36 each (plus $2 shipping, $5 shipping outside USA) $$$

(*) Call 757-686-1271 to order via credit card over the phone!

Qualifications: You must be OVER 18 & live somewhere on planet EARTH!
Please remember, Foreign orders add $5 for shipping instead of $2

ME#3 ..'~ Midnight Escape ~'..

374. ** Atari ST FTP site list **

Newsgroup: comp.sys.atari.st.tech
Date: 1997-01-31 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <32f12b80d180b8@sn.no>
Source record: 18155
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

```
Here's this year's first update to the FTP site list!
A few changes this time:

ftp.uni-duisburg.de * /pub/atari/ (NEW!!!!!!) Small site
ftp.uni-stuttgart.de /pub/systems/atari/ (DELETED)
ftp.hrz.uni-kassel.de * /pub3/atari/ (small site/new dir path)
ftp.on-luebeck.de * /pub/systems/atari/ (small site)
ftp.informatik.rwth-aachen.de /pub/comp/Atari/ (small site)
ftp.uni-giessen.de * /pub/atari/ (small site)

(* = small/specialized site site)

Enjoy!

PS. The WWW version of the FTP list has/and always is updated along with
this text version as well! URL in signature below.

MIRROR SITES

FTP mirrors are alternative sites to certain popular ones which are
usually under a high load most of the time (many people accessing them
at the same time).
Mirror sites contain the exact same directories and files, but have
different entry points. Try to use the one closest to you geographically
and not during business hours (in that geographic area).

MAIL SERVERS

Mail servers can be used to get hold of the same software as through FTP,
but instead of using a lot of download time online, files can be 'ordered'
via email.
In order to get information about how to do this, send an email to the
various addresses below with the word: help
in the mail itself. If possible, do not include any 'signature' in the mail,
as the automated system which replies to these mails tries to interpret any
message (and with a certain amount of errors no response to your requests

will be given at all).

Email server email address Equivelant to FTP site

_____

HOW TO GET FILES VIA FTP

Below follows a step-by-step guide on how to get hold of files via FTP.
Your specific version of the FTP program might differ slightly (it might
have extra functions and be more user friendly etc.) But the main procedure
is likely to be more or less the same.

The examples below are taken from a Unix environment using the usual
'ftp' program. The more user friendly 'ncftp' is recommended though,
as it's easier and more efficient to use.

[1] Starting FTP/logging into FTP site
==========

What to type What it does
---
ftp [ENTER FTP MODE]
open FTPsite-address (i.e: open ftp.funet.fi) [OPEN THE FTP SITE]
anonymous (when asked for username) [INSERT USERNAME]
USERNAME@SITE (your email address- i.e. hallvart@sn.no) [INSERT PASSWORD]

Example:
---
oslonett.no% ftp [ENTER FTP MODE]
ftp> open ftp.cs.tu-berlin.de [OPEN THE FTP SITE]
Connected to caramba.cs.tu-berlin.de.
220 caramba FTP server (wu-2.4/fb13[34] 18-Feb-1995) ready.
Name (ftp.cs.tu-berlin.de:celine): anonymous [INSERT USERNAME]
331 Guest login ok, send your complete e-mail address as password.
Password: celine@geonet.com [INSERT PASSWORD- (NOT SHOWN)]
230-You have reached Berlin, Germany. Access is allowed all day.

** You can also enter a site and start ftp at the same time:

ftp FTPsite-address (i.e: ftp ftp.cs.tu-berlin.de) [START FTP/OPEN SITE]

```
Example:
---------------------------------------
oslonett.no% ftp ftp.cs.tu-berlin.de [START FTP/OPEN SITE]
Connected to caramba.cs.tu-berlin.de.
---------------------------------------

** It's also possible to use the IP number instead of the usual FTP
site address:

ftp IP.number (i.e: ftp 130.149.144.4) [START FTP/OPEN SITE WITH IP NO.]

Example:
---------------------------------------
oslonett.no% ftp 130.149.144.4 [START FTP/OPEN SITE WITH IP NO.]
Connected to 130.149.144.4.
220 caramba FTP server (wu-2.4/fb13[34] 18-Feb-1995) ready.
---------------------------------------

\_\_\_
```

```
Example:
---------------------------------------
ftp> get setseek.zip [GET FILE]
200 PORT command successful.
150 Opening BINARY mode data connection for setseek.zip (3825 bytes).
########
226 Transfer complete.
ftp>
---------------------------------------

Several files at once:
----------------------
mget filenames (i.e: mget ao.lha xyz.zip ps.txt) [GET SEVERAL FILES]

Example:
---------------------------------------
ftp> mget silkmous.zip snip.zip [GET 'SILKMOUS.ZIP' AND 'SNIP.ZIP']
mget silkmous.zip? y [DO YOU WANT THIS FILE (y/n)?]
150 Opening BINARY mode data connection for silkmous.zip (22086 bytes).
##########################################################
226 Transfer complete.
mget snip.zip? y [DO YOU WANT THIS FILE (y/n)?]
150 Opening BINARY mode data connection for snip.zip (17852 bytes).
#########################################
226 Transfer complete.
ftp>
---------------------------------------

** You can also use 'wildcards' to ease the whole procedure of typing file-
names correctly:

Example:
---------------------------------------
ftp> mget ma* [GET ALL FILES STARTING WITH 'ma' IN CURRENT DIRECTORY]
mget maccell33.zip? y [DO YOU WANT THIS FILE (y/n)?]
150 Opening BINARY mode data connection for maccel33.zip (9012 bytes).
##################
226 Transfer complete.
mget mauswind.zip? y [DO YOU WANT THIS FILE (y/n)?]
150 Opening BINARY mode data connection for mauswind.zip (49373 bytes).
##############################################################################
############################
226 Transfer complete.
mget maxidisk.zip.zip? y [DO YOU WANT THIS FILE (y/n)?]
150 Opening BINARY mode data connection for maxidisk.zip (20970 bytes).
########################################
226 Transfer complete.
ftp>
---------------------------------------

** you can also use a 'wildcard' to get hold of single files or a specified
selection. Just be sure the wildcard is unique.
```

i.e. if you want to download 'stzip26.lha' and there are no other files which start with the letters 'stz', you can type: mget stz*.

You can also download all files within a directory with a single command: mget *

PS. you have to use 'mget' with wildcards- 'get' won't work!

Hint: if you're using 'mget' a lot and don't want to be asked if you want this file or not, you can use the command 'prompt'. FTP will then proceed to get all the files that match your wildcard without asking if you want them.

Example:
---
ftp> prompt [TURN OF 'GET THIS FILE (y/n)?']
Interactive mode off.
ftp>

_____

[4] Ending your FTP session
---
close [EXIT CURRENT FTP SITE, READY FOR A NEW FTP CONNECTION]

Example:
---
ftp> close [EXIT CURRENT FTP SITE, READY FOR A NEW FTP CONNECTION]
221 Goodbye.
ftp> [FTP IS READY FOR A NEW CONNECTION- 'OPEN...']
---

quit [EXIT CURRENT FTP SITE/FTP MODE, RETURN TO UNIX]

Example:
---
ftp> quit [EXIT CURRENT FTP SITE/FTP MODE, RETURN TO UNIX]
oslonett.no% [BACK IN UNIX]

** When doing a 'close' and re-entering a new FTP site you won't have to set up features like 'bin', 'prompt' and 'hash' again.
You will however have to set it up again if you choose to 'quit', then restart FTP.

>>

A SHORT SUMMARY OF FTP COMMANDS/PROCEDURE
==========
ftp
open {FTP site address} [OPEN FTP SITE]
Username: anonymous
Password: {your email address}

cd {directory/directory etc.} [GO TO DIRECTORY]
bin [SET TO BINARY TRANSFER MODE]
hash [DISPLAY '#####' CHARACTERS FOR VISUAL CONFIRMATION OF DOWNLOAD]
ls -l (or dir) [FILE/DIRECTORY LISTING WITH LENGTHS]
get {filename} [GET A SINGLE FILE]
mget {filename filename filename filename} [GET SEVERAL FILES]
quit [EXIT FTP SITE/EXIT FTP MODE]

Other useful commands to know
==========
stat (or status) [DISPLAYS USEFUL INFORMATION ABOUT SETUP]
prompt [TURNS ON/OFF 'GET THIS FILE (y/n)?']
get {filename} - (i.e: get 00index -) [DISPLAYS TEXT FILE ONLINE]
!host {FTP site} (i.e: !host ftp.sn.no) [SHOWS IP ADDRESS OF SITE]
help [DISPLAYS A LIST OVER FTP COMMANDS]
help {command} (i.e: help bin) [EXPLAINS COMMAND]

FTP commands

! escape to the shell
$ execute macro
account send account command to remote server
append append to a file
ascii set ascii transfer type
bell beep when command completed
binary set binary transfer type
bye terminate ftp session and exit
case toggle mget upper/lower case id mapping
cd change remote working directory
cdup change remote working directory to parent directory
chmod change file permissions of remote file
close terminate ftp session
cr toggle carriage return stripping on ascii gets
delete delete remote file
debug toggle/set debugging mode
dir list contents of remote directory
disconnect terminate ftp session
form set file transfer format
get receive file
glob toggle metacharacter expansion of local file names
hash toggle printing '#' for each buffer transferred
help print local help information
idle get (set) idle timer on remote side
image set binary transfer type
lcd change local working directory
ls list contents of remote directory
macdef define a macro
mdelete delete multiple files
mdir list contents of multiple remote directories
mget get multiple files
mkdir make directory on the remote machine
mls list contents of multiple remote directories

```
mode set file transfer mode
modtime show last modification time of remote file
mput send multiple files
newer get file if remote file is newer than local file
nmap set templates for default file name mapping
nlist nlist contents of remote directory
ntrans set translation table for default file name mapping
open connect to remote tftp
prompt force interactive prompting on multiple commands
proxy issue command on alternate connection
sendport toggle use of PORT cmd for each data connection
put send one file
pwd print working directory on remote machine
quit terminate ftp session and exit
quote send arbitrary ftp command
recv receive file
reget get file restarting at end of local file
rstatus show status of remote machine
rhelp get help from remote server
rename rename file
reset clear queued command replies
restart restart file transfer at bytecount
rmdir remove directory on the remote machine
runique toggle store unique for local files
send send one file
site send site specific command to remote server
Try "rhelp site" or "site help" for more information
size show size of remote file
status show current status
struct set file transfer structure
system show remote system type
sunique toggle store unique on remote machine
tenex set tenex file transfer type
trace toggle packet tracing
type set file transfer type
user send new user information
umask get (set) umask on remote side
verbose toggle verbose mode
? print local help information

** Most of these commands work as 'on/off switches'. Each time you enter the
command it switches over to the opposite position (from on to off or
vice versa). If you're not sure about it's position, type: stat
(or: status) which will show your setup.

Be sure to check if transfer mode is set to 'bin'!!!! (if you try to
download binary files in ASCII mode all your downloads will be useless!-
You can download text files as binary as well, though you sometimes might
have to convert the end-of-line characters afterwards-
(get hold of 'unix2st.ttp' or similar program for this).
```

Hi,

Bit weird actaully finding an ST news group (does nothing ever die).
Anyway I've got TWO non-working SM124 mointors. I'm in the centre of
London. Your's for 10ukp each. Don't know whats wrong with them.

Pete

376. Re: .AVR file-format - How ?!

>
> http://www.cs.ruu.nl/wais/html/na-dir/audio-fmts/.html

Ah, you found it! I did a search with Yahoo and couldn't find the audio
formats FAQ. :-)

>AJ, maybe you should have this link in your page?

Yep, added in programming section, and also on links page. :)

-----BEGIN PGP SIGNED MESSAGE-----

I'm reposting this here on behalf of Colin Fisher-McAllum, SysOp
of 42 BBS, as he hasn't quite mastered his usenet stuff yet.

Point of note: before anyone asks - yes, Daron does know that
this is being posted. In fact, he specifically requested that
Colin post something to let everyone know what was going on, and
why the NeST BBS network would be down.

Please don't email either Colin or I about this: everything
either of us knows is contained within this message.

I also urge all of you to think before posting any replies.
Remember that judicial laws state that someone is innocent until
proven guilty - Daron is a well-respected member of the Atari
community, and idle speculation would only harm his reputation.

Original from Colin Fisher-McAllum follows:

================================================================
====
I am sorry to say that until other arrangements can be made,
NeST is
closed.

Daron Brewood was raided this morning and all his equipment
impounded
subject to an investigation into computer pornography.

Regards

Colin

> from the ROM are gives you a file full of zeros.

That's because the hardware (DMA, SHIFTER, BLITTER and so on) has no
access to ROM address space, only to ST Ram space. Try to move the
hardware screen pointer to point a ROM location; very nice ;-) ;-).

The previous words can depend of the Atari model you have, of course.
MMU/GLUE is fairly different in ST and STE systems.

I would like that info too!

I saw a homebrew hostadapter schematic with layout in ST computer(?)
a couple of yrs ago, but it was crammed with GALs and no
equations or JEDEC files was printed in or supplied with the mag. :-(

I have the following SCSI hard drives for sale:

Quantum DSP3053L SCSI-2
Formatted 535 Mb
Cache Buffer 512k
Average Seek 9.5 ms
Rotational Speed 5400 RPM $325.00

Maxtor LXT-340SY SCSI-2
Formatted 340 Mb
Cache Buffer ?
Average Seek 12 ms
Rotational Speed 3600 RPM $225.00

Reason for selling, moving up to a 4.2 gig Baracuda

If interested, you can call me at 860-0302
(Waverley/Fall River/Wellington)

Thanks..

>
>Yes, with an adaptor...

No, not if the "atari" in question is an ST, a Mega, or an STe or Mega STe.
A plain VGA monitor syncs to a 31.5 kHz horizontal sweep rate; the ST uses
15.75 kHz (NTSC standard - minor adjustments for PAL machines but the same
range).

A multisync monitor that can sync to 15.75 kHz horizontal can be used with
an ST, however.

See ftp://ftp.teleport.com/users/atari/multsync.faq for details, including
how to make your own adapter, and a list of monitors that are known to work
(and a few that have similar model names that will NOT work).

: SCSI 2 compatability.

: Regards, Derryck

That's absolutely NOT true Derryck. The early Link II's didn't have the
lable changed yet they are identical to all Link II's. The extremely easy
way to tell if it is in fact a Link II regardless of the lable is this:
If the 'i' in the word 'Link' is an L.E.D. then it is in fact a Link II.
And that L.E.D. will light up when the unit is functioning.

If it is NOT an L.E.D. but instead just 'printed' on then it is a Link I.
-That's all there is to it.

john,
Don't know if this is what you are looking for, but the January,1989,
copy of ST LOG has an article on building a 16 bit cartridge port
interface. Don't know if you'll ever find the article, I don't actually
have it, just the reference to it.
Good luck.

>It's not a Link II unless it says so on the label. Don't buy it if you want
>SCSI 2 compatability.

Not necessarily! I bought a 2nd hand Link II unit labelled "The Link" and
it's definitely a Link *II* unit as I've tested it with both parity on and
off.
The Link II as opposed to the Link (I) has a small red LED that lights up
when in use.
I contacted ICD Inc. to verify that my unit in fact was a Link II and why
they had didn't label it as "The Link II"; they told me that they had a
bunch of old labels left over from the Link (I) production, and they wanted
to use them up first before printing new ones.
And that the Link II, as I said could be identified by the LED.

So.... if your unit has a small red LED (light) on one side of the unit it
is a Link II. If not it's just a Link (I).

PS. Sorry if this messages comes twice- I had some problems with my
mailserver earlier today.

If you use HDDRIVER in combination with Big-DOS (included on the
HDDRIVER driver disk) or MagiC 5 there is no 32 MByte limit. HDDRIVER
supports DOS partitions up to 2 GByte and is also capable of creating
DOS compatible partitions of this size on the Atari.

>Cool.

Even more cool is that coming soon is a way of Makeing SAA files (so that
programs can use 'system sounds' for cut/copy/paste etc. and programs
can add 'application' sounds so that eg. Antmail could use SAM to play
a sample (of the users choice through SAM of course) whenever new email
is recieved.

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi All!.

I'm just about to install an overscan board into my STFM (The Autoswitch lacescan version). The circuit I can make without any problem (its just one quad d-type flip flop IC and one triple 3 input nand gate). However, the connection details that are included in the file 'overscan.zoo' are only for revision 7. motherboard STs.

I have not opened my machine up yet, but it would be helpfull if anyone can give details of the glue chip (I.E. serial number/pinout etc, so that I can find the DisplayEnable signal for the overscan board.)

Thanks in advance,

Brian.

402. MiNT Multiuser Setup.

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-03 00:00:00 UTC
From: Ben Hills <ben@imperial.co.uk>
Message-ID: <32F658C7.5A90@imperial.co.uk>
Source record: 18183

Hi All,

I have recently installed MiNT 1.12h, MiNTOS 1.4.1 and MiNTNet on
my Atari Falcon030. I have an Atari 1040STE running Connect and
hanging off the MIDI Ports, and a rather old P.C. Running a VT100
Terminal emulator, which is hanging off the Serial Port. This runs
great. The problem I am having is with TCP/IP. I have MiNTNet running
on the Falcon, and STE but I do not seem to be able to establish a
TCP/IP Link between the Falcon and STE, on neither the MiDI, or Serial
Ports. I iwsh to be able to Telnet, Rlogin etc, from my STE to
my Falcon. I think I have all the correct files in /etc, but every
time I try to telnet, I receive an error message:

100.0.0.1 homer
Network is unreachable.

Can anyone help?

Thanks,

Ben Hills.

403. Re: Overclocking the 68000

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-03 00:00:00 UTC
From: Sam Ellis <sce196@ecs.soton.ac.uk>
Message-ID: <Pine.LNX.3.91.970203171845.16310A-100000@mull>
Source record: 18184

I have devised a possible circuit for overclocking the 68000:

multiplexer

```
+-\
16MHz CLK ---| \
| |--- 68000 CLK
8MHz CLK ---| /
+-/
|
__ +---\ |
AS ---| \ |
| AND |---+
GPO ---| /
+---/
```

The old 8MHz clock and the 16MHz clock from the shifter are fed into a multiplexer, which is switched from the output of an AND gate. The inputs to the AND gate are the AS(complemented) pin from the 68000, and the unused General Purpose Output from the mo nitor socket.

The GPO would provide a means of controlling the circuit via software, thus enabling it to disabled if necessary. It would probably be best to have the 68000 operating at 8MHz by default, incase the OS or any other boot programs aren't compatible. It woul d be a simple matter to use a small AUTO program to switch into 16MHz mode.

BTW, this would involve cutting the CLK pin on the 68000, so it's not for the faint hearted!

Does anyone have any ideas as to whether this would work or not? Presumably, one would have to ensure that the propogation delay for the circuit was quite small, to avoid the 68000 and bus becomming out of sync. The only potential problem I can think of is during the transition from 16MHz to 8Mhz, when the 8MHz clock may be halfway through a cycle. However, there may be enough slack in the system for this not to be a problem.

I don't have enough confidence at the moment to try this out. I will need to get some more detailed info on bus timing etc. before I even consider thinking about it.

Sam Ellis.

Did you get any kind of software with the SCSI adapter? If not, you need to
download or purchase something - I suggest you download the Supra utilities
for immediate use, and purchase HD Driver for the long term. You can get
Supra's drivers at ftp.supra.com (of course).

I just picked up a used NEC 3D in pretty good shape but I didn't get a manual with it and had a few questions.

1) Other than the front control pop-down panel, is there anywhere (like the access plate on the back-but how do you get it open?) that you can adjust the clarity/sharpness?
2) What are the NEC 3D's stats? For example hi/lo res, colors, synch freq's etc,...
3) If I use ScreenBlaster/BlowUp 030 can I get a 256/TC desktop in 800 x 600 resolution? (I'll be using the Multisynch Gizmo with it for RGB stuff)

Thanks in advance! :)

>
> See ftp://ftp.teleport.com/users/atari/multsync.faq for details ...

I'm trying to get an IBM-compatible monochrome monitor to work as a mono
monitor fo my STe; I suspect that the sync pulses may be the wrong
polarity, as I just get a swimming display - comparing frequencies in my
various manuals, it appears the monitor should be capable of displaying
the image, as long as it gets the sync pulses the right way round so it
can sync up correctly... I have witnessed an ordinary mono IBM monitor
(not multisync) working perfectly as an ST monitor, so I know it ought to
be possible.

Can anyone suggest anywhere I might be able to get help with this?
Circuit diagrams/advice/abuse/suggestions etc. much appreciated.

Any kind of overclocking would probably require severing that line, so I guess it's a matter of wanting a faster CPU bad enough to snip it. :-)

S >

Look into the HALT signal in the 68000, it can be triggerd by an outside event, or internally by the CPU, this might allow you to pause processing while the cpu switches speeds.

S > I don't have enough confidence at the moment to try this out. I will

Books about the MC68000 family are usually to be found at a library. There is one put out by Motorola (of course), and another by SAMS. Yet another book I found with some nice details on the 68000 was "The Handbook of Microcomputer Interfacing".

I am assuming that a logic '1' on the AND gate output switches the 68000
clock to 16 MHZ. Therefore, if AS or GPO is '0' ,CLK is 8 MHZ.

If AS is '1' and GPO is '0', then CLK is still 8 MHZ.

Therefore, GPO allows/denies the CLK switchover, while AS controls the
actual switching point.

Yes, very tricky!
>
> Does anyone have any ideas as to whether this would work or not?

I have done a similar modification, without the GPO control circuit.

It looks workable, provided the propogation delays are not excessive.

> Presumably, one would have to ensure that the propogation delay for the
> circuit was quite small, to avoid the 68000 and bus becomming out of sync.
> The only potential problem I can think of is during the transition from
> 16MHz to 8Mhz, when the 8MHz clock may be halfway through a cycle.

Yes, this looks hairy. I don't think its possible to allow GPO to control
the exact clock switchover point. Do you know what value GPO has on
startup ?

AS goes low fairly early into a BUS cycle, and gets negated before DTACK.

You might have to synchronise GPO to the DTACK signal, so that it only
allows the CLK signal to switch when the CPU has finished with the BUS.

> However, there may be enough slack in the system for this not to be a
> problem.

The CPU does not seem to mind a CLK switch BEFORE it starts to use the BUS
and AFTER it has finished with the BUS.

>
> I don't have enough confidence at the moment to try this out. I will need
> to get some more detailed info on bus timing etc. before I even consider
> thinking about it.

I have built and installed a one chip version of the circuit (ST has no
control over CLK frequency). It works well. Your version should work also,
if you tie the GPO input to GND.

Some time ago I saw a post here (or was it c.s.a.s?) explaining how to connect an Atari CX-80 "trak-ball" as an Atari ST mouse.

Unfortunately, while the information explained that certain pins had to connect to an IC in the lower right corner of the PCB, exactly which pins on the IC was not very clear.

I would appreciate it if someone could post come complete instructions on how to adapt th trackball in the above mentioned manner either here in c.s.a.s.t. or to my email address.

Yes, that was the intention. But if all software works correctly, then
the GPO addition won't be needed.

>> BTW, this would involve cutting the CLK pin on the 68000, so it's not for the
>> faint hearted!
> Yes, very tricky!
I have just found out that CLK is pin 15 on the 68000 - right in the
middle of a row of pins. This would make it hard to cut.
BTW, how easily is the 68000 damaged, e.g. by heat from soldering, or
static?

> Do you know what value GPO has on startup ?
I believe it is a logic 0, but I'm not entirely sure about this. I don't
have any test gear, but it should be possible to find out by examining
the registers of the sound chip.

> What sort of performance improvement is there? What chip did you use?

I used a 74HCT00, but a 74HC00 would work also.

I got an overall increase in speed of about 11%.

But some operations like Blitting are 35% faster.

It speeds up ROM access, so everything that uses the ROM is a bit quicker, eg.
Floating point math is 16% faster.

I will be sending a file of instructions to Hallvard's Web site as soon as
my external E-mail is working again.

I'll try to look at that this coming weekend, Mario. Haven't had much free
time lately, but I do have the modified CX-80 (several of them, actually).

>Xtra-Ram Deluxe for the ST (f)(m) ?

You want four identical SIMMs, 30 pin, either 256k each for 1 meg RAM (a silly idea these days), or 1 meg each for a 4 meg ST. It doesn't matter whether they are 8 or 9 bits wide, 2, 3, 8, or 9 chip, as long as they are all alike. Any currently-available speed should be fine - the ST Will work as slow as 150ns, and most available SIMMs fall into the 70ns range.

You need to supply power to the Link - the Zip drive doesn't do that IIRC.
Hopefully someone here can tell you which pin on the Link's SCSI port should
get the +5v (I can never remember). You can either modify the Zip drive
(not recommended) to put +5v on that pin, or make up a very short
SCSI-to-SCSI cable with a long lead to plug into your joystick port, and
steal power for the Link from your ST.

Why not use the one that comes with System 6.0x that you're using? If
you don't have one, you can d/l any number of HP drivers from the
internet. You can get drivers from www.apple.com I suspect...

I have the following SCSI hard drives priced for quick sale:

Quantum DSP3053L SCSI-2
Formatted 535 Mb
Cache Buffer 512k
Average Seek 9.5 ms
Rotational Speed 5400 RPM $280.00

Maxtor LXT-340SY SCSI-2
Formatted 340 Mb
Cache Buffer ?
Average Seek 12 ms
Rotational Speed 3600 RPM $180.00

Both drives are in excellent condition and comes with documentation.

Reason for selling, moved up to a 4.3 gig Barracuda.

If interested, e-mail me at the address below, or you can phone
860-0302

Thanks..

Yup, Get mint with minix or magic with VFAT.
That will work. bye :)
However the desktop from thr ROM can not display the longfilename
correctly.
You woudl need an alternative desktop.
However Magic comes (I believe) with it's own desktop.

Check out my Updated Atari Catalogs and find More Atari stuff! I've got Monitors for your Atari 8 Bit like Commodore CM-141 "Like the Commodore 1802" And Disk Drives for the Atari 8 Bit like Stock 1050 and a 1050 Duplicator Drive for Backing Up Software. Plus I've bought out the Game Cartridge Gorf for the 400 & 800 & the Educational Math Game Cartridge Space Journey for any Classic 8 Bit Atari Plus I've cornered the Market on New Copies of Print Shop and some Print Shop related Items! That's Gorf, Space Journey & Print Shop All New Copies, All for the Atari 8 Bit! Plus a Good number of SSI and Avalon Hill/MicroComputer Games, and Many of them are Complete. Plus some Flight Simulator II from SubLOGIC including Scenery Disks all for the Classic Atari 8 Bit. For the Atari ST & newer Computers I've added to my HardWare Catalog Supra Hard Drives, Spectre GCR Mac Emulators, Indus (Future) GTS-100X Disk Drives, Panasonic MultiSync Monitor that does Double Duty for both ST Color and MonoChrome Monitors and the Cable/Hardware to your ST Computer. I've also added Software to my ST Catalogs & revised my prices. Titles such as Brand New copies of Ultima V for those of you Ultima Collectors and for those who like Flight Simulators, theirs F-15 Strike Eagle, F-16 Combat Pilot, Falcon, Falcon extra Missions Disk, Fighter Bomber and Flight Simulator II. In Productivity Software, theirs Data Manager ST, Degas Elite, Easy Draw, MultiDesk, NeoDesk, Revolver & PageSTream. All for the ST.

See my Web Page at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. At BSC's Web Page you can View, Capture and even DownLoad Atari Catalogs or Contact BSC by Web Page! Or Request Catalogs by E-Mail. Do You Have problems connecting with BSC's web page? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Please let me know if I can't attach files to your E-Mail. I'll get back to you after the weekend. Catalogs are sent only by E-Mail. Not Snail (Postal) Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS. The Most Powerful BBS SoftWare on any 8 Bit Computer Platform. For the 8 Bit Atari. Register with Shadow Software to keep the support coming.

I've added to my Web Page an area for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page.

Also, on BSC's Home Page! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Page with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Page. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

--

Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or by WebPage at www.teleport.com/~bensmith/bscomputers.shtml Catalogs Requested by & Received Through E-Mail at bensmith@teleport.com Please Specify Classic 8 Bit or ST!!

Well, you could either get Magic which uses the Windows 95 VFAT filesystem (crap, crap, very crap) or you could get MiNT with Minix and have a proper filesystem which is very, very fast. Both offer long filenames. Magic costs money, whereas MiNT and Minix can be downloaded from any good Atari FTP site.

Cheers,

James Cox.

437. Falcon Audio internals?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-08 00:00:00 UTC
From: shc103@york.ac.uk
Message-ID: <5dhm0i$r55@netty.york.ac.uk>
Source record: 18118

Hi all.

I'm considering buying a Falcon for use as a realtime sample-player in music performance. Being in my second-year as a computer scientist, I could probably write the necessary software myself, but I wonder whether it's possible to get hold of the hardware spec of the Falcon (or even just of it's audio?!)

Having owned an ST and had a brother with an STE, I am aware of how badly Atari publicise their technical data. Failing that, it there cheap/free software that will do this? I've heard of cubase Audio but I assume that's quite pricey. Here's a quick outline:

The program:
MIDI in, realtime samples out (min. 4 channel I think)

The info required:
Overview of Falcon audio
I/O and Memory maps of Falcon
68030 instruction set (I can no doubt find this elsewhere)

Other stuff possibly required:
A decent compilable high-level language for the Falcon
(or maybe even C :))

Thanks in advance,

Steve.

From: Larry Koenigsberg <larryk@efn.org>
Message-ID: <5di7sv$1r7@haus.efn.org>
Source record: 18120

I have owned this printer for years as part of my Atari ST. (I believe it is a Mannesman-Talley printer because the ribbons I buy for it are M-T compatible.) I recently purchased a PC-compatible and am trying to connect this printer to it. To my dismay, I can print to it from DOS, but the Windows 3.1 generic text-only printer driver chokes and tells me that the connection to the printer is bad. Do you have any suggestions as to how I can make Windows talk to this printer, or how to contact Atari to see if they can suggest anything? Mannesman-Talley seems to have gone the way of all flesh, judging by the minescule presence of that name on the Internet.

Please email any response directly to me (larryk@efn.org) as I am not a regular at CSAS -- thanks.

Are you into HOT CHAT? We've got the world's largest voice-personal dating system, as well as the hottest, sexiest "1 on 1", "2 on 1", and "PARTY-LINE" chat you'll find anywhere, all in one place! And you don't have to call a 900 number to get in on this hot phone fun!

You can choose from 5 hot programs that are sure to fulfill your every desire!

You can press 1 from the main menu to choose from our sexy "1 ON 1" PLEASURE MENU, then:
*to talk to a BEAUTIFUL SEXY GIRL, press 1.
*for a 1 on 1 session with an experienced DOMINANT MISTRESS, press 2.
*for steamy talk with a LUSCIOUS TRANSVESTITE, press 3.
*for an erotic 1 on 1 chat with an EXOTIC TRANSSEXUAL, press 4.

*for some man to man action with a HOT GUY, press 5.
You'll be billed just $3.99 per minute for your selection.

Or you can press 2 from the main menu to DOUBLE YOUR PLEASURE, then:
*to speak to 2 HOT SEXY GIRLS, press 1.
*to get it on with a swinging WILD COUPLE, press 2.
You'll be billed just $4.99 per minute for your selection.

Or you can press 3 from the main menu to join the GROUP ORGY LINE!
*You can party with the nations nastiest swingers for only $2.50 per minute.

Or you can press 4 from the main menu, then:
*Press 1 to join the FANTASY NETWORK. This is the world's only phone service that allows you to connect with people who share your personal fantasies. This state-of-the-art voice mail system lets you listen to messages from beautiful girls, sexy transvestites and she-males, gay and bisexual males, and dominant women. Leave them a hot and sexy message, then call back to see what erotic message they have left for you. You'll be billed just $3.50 per minute.
*Or press 2 to listen to a hot selection of recorded fantasies steamy enough to make you explode! Choose from beautiful, sexy women's fantasies or domination stories. You'll be billed just $2.49 per minute.

Or you can press 5 from the main menu for the HOT AND NASTY DATELINE, where you can listen, and respond, to voice personal ads from hot horny girls in your neighborhood, including their real names and home telephone numbers! You can also leave your own personal message for people to get in touch with you. Make new friends on the world's busiest voice personal lines! Meet singles or couples, gay or straight; you'll be billed only $2.99 per minute.

***JUST CALL 1-800-756-3906 to use your Mastercard, Visa, or American Express card. The charge is just $2.49-$4.99 per minute, plus a 50 cent connection fee. 18+ only.

***OR CALL 1-900-745-4398. The charge is just $2.49-$4.99 per minute. Must be 18 years of age or older.

Call now!!! YOU WON'T REGRET IT!

Okay, I've figured out how to use the Mode On/Off switch to setup my NEC-3D for RGB on one and VGA on the other, but is there any way that I can have this multisynch monitor auto-switch modes itself? Thanks in advance, and please E-Mail as I don't always get all the newsgroups messages... :)

Yes... you need a Link II (the Zip uses parity).

I don't know where you would get one from (sorry).

>Which type of C language (K&R/ANSI) is the best to program in if I
>want to be able to port the software (as easily as possible) to the
>PC?

It's difficult to say without an idea of what sort of software you
intend to write, or what the intended source and target platforms are.

Am I correct in making the assumption that you want to do coursework
at home then get it running on a PC at college?

>Which version (Lattice C, MWC, Pure C, etc.) is the best all-around.

MWC is a good solid compiler - I've been using it for years but it is
mostly K&R so forget it. Lattice and PureC are both ANSI compilers
which is the very least you ought to be looking at imo.

>I am currently a GFA BASIC 3.5 programmer and would like to begin
>programming C.

Lattice or PureC then - both are integrated development environments.
Command line systems can be more powerful but take time to master.
There is a steep learning curve with C (and pointers) - you struggle
in the dark for ages thinking you are never going to "get it", then
suddenly one day it all fits together and you wonder what you ever
thought was so hard about it. C literature is responsible for this -
it likes to be cryptic about pointers, making them out to be some
black art when in fact there is nothing to it. The rest of C is a
doddle to learn.

>I have an old copy of Pure from ST Format (1.5(?)) but no libraraies.
>I would like to begin taking advantage of some Compendium code and other
>source I have laying around (also, GFA 3.5 doesn't like to run in Falcon
>640x480 res.)...

Someone else will have to confirm this but I _think_ PureC should run
in any resolution as should Lattice. I do know there are problems with
MagiC and the Lattice front end though.

452. Floppy write problem

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-10 00:00:00 UTC
From: Samuel Johansson <s94sjo@student.csd.uu.se>
Message-ID: <32FF942B.1901@student.csd.uu.se>
Source record: 18045

Hi

I'm having major problems with my 1040STFM.
It began after I had left it running for a long time (I mean a REALLY long time, probably a month or more) without shutting it off. I wasn't using it at all during that time so I don't know when it actually stopped working.
This is the state it is in right now:
When I turn it on after it has been switched off for more than 5 minutes the screen is totally garbled (strange black and white, stretched and fluttering) and it won't boot. If I leave it on it seems to 'warm up' and the screen slowly turns into plain white. It still won't boot, but if I reset it, it boots OK. From now on it seems to work fine. The really big problem is that it won't write to the floppydrive. If I format a floppy, it will gladly do it, including verifying the formatted disk, but when I open the disk it still has all the files on it that it had before I formatted it. If I delete a file it disappears from the disk window, but when I later read the disk it is still there (not just the directory entry, but the entire file). Reading from the disk is no problem. I don't have access to any other diskdrives, and I don't have any hard drive, so I don't know if the problem is with the drive, the cable, or the floppy controller. RAM disks are not affected by this. I can write to the RAM disk without any problem.
The only modification of the computer is that I installed a 4 MB memory upgrade about a year before all of this happened. I would appreciate if anyone could give me some advice on how to fix this.

```
h > Which type of C language (K&R/ANSI) is the best to program in
h > if I want to be able to port the software (as easily as
h > possible) to the PC?

ANSI. In fact, Pure C is a based on Borland's Turbo C for PCs.

h > Which version (Lattice C, MWC, Pure C, etc.) is the best
h > all-around.

Pure C is best, but Lattice C nearly as good and is less expensive.

h > I have an old copy of Pure from ST Format (1.5(?)) but no
h > libraraies. I would like to begin taking advantage of some
h > Compendium code and other source I have laying around (also,
h > GFA 3.5 doesn't like to run in Falcon 640x480 res.)...

The latest version of Pure C is 1.1 (version 2.0 is tied up in a
court battle with Borland). You might contact ASH about replacing
the libraries.

Also, there is a shareware English version of the online help
available (which has even more info than the Compendium), but you
will NEED the HC.TTP program included with Pure C to install it.

Source record: 18047

My Falcon cannot sample at 44.1KHZ (or the other common sampling rates). I have been told that mayor Falcon audio sequencing software comes with an small box that allows the machine to sample at 44.1KHZ.(external quarz clocking device?) How is this accomplished? What is exactly is the box? Can I do the same modification internally?

When dowloading files from the net, it always plays them at different speed; any software that can play at the right frecuency?

PS: Who has got an schematic diagram for Falcon, is any store selling one?

Any help will be appreciated ;) Best wishes: Phill.

What kind of Quantum drive is it you're talking about? If it's a Quantum
Fireball it will only work with the ST if you use a LINK96 host adapter.
Any other adapter won't work because the Fireball drives require SCSI
initiator identification (i.e. the ST needs its own SCSI ID) and only
the LINK96 offers this feature.

Hi!

> I just picked up a used NEC 3D in pretty good shape but I didn't get a manual
> with it and had a few questions.

Nice thing, repaired six of them, they had all the same error (line transformer
(or however this thing is called in english, in german it is
"Dioden-split-transformator") defect).

1)
The rear panel is a fake, if you remove it (that's easy if you remove the
3ds cover and release the plate from the inside :-) you face another, not
removable plate.

You might try to adjust the focus to increase sharpness. Just open the monitor.
Of you look from the rear into it you'll see a black thing at the lower right
edge that is connected to this rubber thing on top of the tube. This thing
(the obove mentioned transformer) has to regulators, one is labeled screen
and one is labeled focus. Now get a plastic screwdriver (really, don't try
this with metal/or isolated metal screw drivers, it's not worth the risk) and
adjust the focus regulator.

2)
millions of colors, hsync 15-35kHz, vsync 50-70 Hz, works for all three st
resolutions!

3)
800x600 is possible at low refresh or interlace.

Hope that helps,
Till

From: ugg1@rzstud2.rz.uni-karlsruhe.de
Message-ID: <5dn2s1pts1@nz12.rz.uni-karlsruhe.de>
Source record: 18136

I've downloaded MiNT and XAAES and have problems with the installation. I've tried to install MiNT (I haven't got MultiTOS) as it is written in the .DOC-files. As I restarted my Atari 1040STF - 3MB (Imex), the only thing I could notice was that the U-drive was installed with all its subdirectories, but as I tried to run a GEM-Programm (1st Word), the computer crashed down.

Can anybody help me with this?

And another question:
If I have XAAES, do I still need MultiTOS to multitask more than one GEM-programme?

I would be happy, if I had an answer soon (please mail, not post)
Thanx.

You may try to find an Atari Falcon programming book, they are two
(as far as I know) : The Atari Compendium and Modern Atari System
The Atari Compendium may be still available in UK from HISOFT or
SYSTEM SOLUTIONS as I got it from there one year ago.
I think the M.A.S.S. comes from HISOFT but I'm not sure.

You can also try to find a file named hardware.txt on an atari related
ftp site, this file lists all registers of all Atari computers, but no
information about programming, system functions ...
The last version of this file is the 7.0

I recently downloaded LHA11321.TTP, and managed to extract the
documentation files included in the program/archive. Unfortunately,
the program will NOT extract itself because it was stored in LZ6
format. I have not been able to find another LHA/LZH program that
will handled this method of storage. Does anyone recall the LZ6
type of archive? If so, which program would archive/extract using
this method? Is it possible, that this was done on another platform?

> and what results can it offer. Please, include the software list also.
> Any problems?
CD-Tools (newer than 1994, I guess) will handle IDE CD-Roms. The only
problem is that it has to be a real IDE CD-Rom! Many, usually older, IDE
CD-Roms are just "half"-IDE, and those need special drivers. I've tried
two IDE CD-Roms, one toshiba (if I remember correctly), and one Gold Star.
The Gold Star work instantly, but the other one didn't even get
recognised as a CD-Rom.

All you need is an ATAPI-standard IDE CD-Rom + CD Tools and a 2.5"->3.5"
IDE Cable.

> Please, followup here and to my private email also.
Hope this helped!

You didn't say which host adapter he's trying to use, but I would venture that it's not the ICD AdSCSI+ (or The Link 2, or Link96). Disable parity on the drive. /IF/ it's not a drive that requires initiator identification (I think the Fireball is one that does require it), it ought to work. If, OTOH, it /does/ require it, you MUST have HDdriver from Uwe Siemet - and you will not be able to boot from that drive (but it can be used as long as you boot from a floppy, or another hard drive).

It's a Quantuum LPS drive. However, things have taken a turn for the worse. Power supply on the hard drive died and a couple other things have gone wrong with the ST. So maybe it's just defective hardware causing problems. Not quite sure what my friend's going to do with it now. Thanks for the help though.

This is nonsense. Most modern hard disks support parity and if you have
a driver that supports it for SCSI on the Atari, e.g. HDDRIVER, this
means more security for your data.

Me too. The only problem is with cascading menus, and this is fixed
with MENMGR installed.

Would that have been an Extra-RAM board by chance ?

Your symptons are like those of a memory problem.

Might be a loose connection or bad solder joint.

Check the cable connected to the MMU socket, the assembly might have
unseated the MMU chip.

Check for bad connections on the Shifter cable.

Re-seat the chips (if possible).

474. Re: Overclocking the 68000

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-11 00:00:00 UTC
From: Rob.Schafrick@taf.to.org
Message-ID: <55b_9702110900@to.org>
Source record: 18055

Interesting dialogue going on here about overclocking the 68000.
My concern is with switching back to 8Mhz from 16Mhz halfway
during a cycle. It would then seem imperative to ensure that the
switch occurs after a complete cycle, rather than halfway.
Wouldn't the effect of doing so be unpredictable?

Then again I could be dead wrong...

This may sound cold, but why not get a TT or Falcon instead?

Cheers...

LZ6 is a PC extension on LZH. It's not yet supported on the ST. If I am not
mistaken LH6 will be depacked with:
LHARK from Kerwin F. Medina (kerwin@digi.co.jp)
on a MS DOS computer.

Hope this helps,

Hans Wessels

I believe that it only supports hardware access (as a type
of very fast serial interface). The same goes for the TT and
Falcon030. I don't know if anyone has written any driver
software to use a LAN through these ports.

Hmm - which version of MagiC do you have? I guess it must be 5 because
I've been told the Lattice menus don't drop but that was before 5 was
released.

With the HBS640 you must reboot to change from 8mhz to
36mhz. The cache can be changed at any time.

Katherine is right. If you look in your Falcon manual
I think it shows the pinouts for the DSP. You will see
a pin that accepts an external clock signal. You can almost
make your own DSP clock from this pinout. I have further
diagrams if you feel you can attempt this. You will also
have to use software that will recognize this modification
and let the machine play back at the new signal speed. Some
of the shareware and PD players and recorders have this option.
Cubase Audio uses the same mod to get the frequency you are looking
for.

Couple of reasons...

1. Can't afford it!

2. Not easy to get hold of.

3. It's fun to hack.

You need a harddisk driver that supports the PC partition scheme, especially
for partitions > 32 MB. IIRC CBHD doesn't do that, so your cartridge isn't
recognized as useable. HDDriver fully supports PC partition tables, so your
cartridge should be recognized with this driver. Btw, there's a demo version
of HDDriver available at ftp://acp5.chemie.uni-kl.de:/pub/atari/

Ciao

Do tell more about the CX-80 trackball. I haven't really heard much about
it. I guess they beat the standard Atari mouse (which isn't too hard!)..
Were these trackballs made for the older 8-bit Atari computers or
something? Are they still available from somewhere?

No, not exactly. I've been messing around for years (about 10) in GFA and I now feel it's time to move on to a real language (at _least_ one that is supported :). I have several things I've written for myself, as well as with Dave Munsie (remember him?) a while ago. I wanted to re-code a few things in C on the Atari. I've also been quite interested in writting a modeller for POV-Ray (or at the very least, port one over to the Atari from the PC)...

> MWC is a good solid compiler - I've been using it for years but it is
> mostly K&R so forget it. Lattice and PureC are both ANSI compilers

ANSI is the desired direction, so that I might be able to port from an Atari to the PC, etc...

> Lattice or PureC then - both are integrated development environments.

I'm ready to learn! I've pretty much narrowed it down to either Lattice or Pure C. Any suggestions out there as to which might be better for me? I want an all-around environment for writting game code to apps.

I would venture to guess that Best or B&C probably has them; I think I may
have some in shrink-wrap myself.

The CX-80 is a dark grey, roughly as large as a desk-style speakerphone, and
can be comfortably used in your lap. The ball is about the same size as a
billiard ball (looks like a cue ball, actually). They were originally made
for the 8-bit machines and switchable between "joystick" and "trackball"
modes; after modification, they're pretty good ST mouse substitutes, and
with some added work, can also have a standard mouse or joystick plugged in
through them.

: Well, you could either get Magic which uses the Windows 95 VFAT filesystem
: (crap, crap, very crap) (...)

Yeah, I just recently saw the docs on the VFAT fs in some Linux Howto
file... Tjeez! It's a classic Crap Microsoft Backward-compatibility Patch!
It uses additional entries in the dir table which are sort of masked of from
the normal DOS fs to store additonal characters for the file name. That's
why W95 locks it's filesystems: to prevent properly written programs like
Disk Doctor from messing up (ie. fixing) the "crap" extra dir entries...
Unbelievable...

502. TOS 2.06 bug?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-13 00:00:00 UTC
From: lais@cs.man.ac.uk
Message-ID: <5dva4j$i0m@m1.cs.man.ac.uk>
Source record: 17995

Hi,
Anyone out there know that TOS 2.06 has problems reading certain types of disks which work just fine under 2.05? This is probably only of concern to Mega STE owners stuck with 2.06 but *nobody* seems to have an answer.

The problem definitely exists - I found out by borrowing a set of 2.05 ROMs and tested a few games that wouldn't load.

I can't understand that everyone says Pure C is better. I have read several times that Pure C compile fast but produce some rather crap code.

I read a very good test made by Johan Klockars between Pures C, Lattice and GCC. Pure C was the worst of the 3. Lattice produced some rather good code, but made some major faults when trying to optimize. GCC was the best overall and Pure C didn't do much more then just translate the code as it was into machine code.

I guess Johan could dig up the old test once more if someone wants to read it.

I would say that Lattice C is the best. You get alot of tools and up todate libraries (atleast as uptodate as they can get) and very good documentation and not atleast, it's in a language you can understand. GCC is also very good if you like the way it works.

Has anyone developed a lowcost 44kHz alterantive? I should be relativ
easy. Just feed a new clock into the DSP port. Shouldn't need to cost
much more than the cost of the connector and a 22.5792 MHz crystal.
Has any one treid it?

'special software' is a bit of an exageration. All that needs to be done
is changing one of the parameters to the OS calls. This could possibly
be done with a hex editor... (and a little work finding which byte to
change)

>Has anyone developed a lowcost 44kHz alterantive? I should be relativ

Yea, I agree it should be quite simple... If I knew anything about
hardware then I might have thought of trying, but as I dont know the
hot end of a soldering iron, then I think I should stay well clear
of fidling with this... :)

Alternatively, you could write some software which actually used the DSP
(= hard to do) to interpolate and filter the samples from 44.1kHz
up to one of the standard Falcon frequencies. This is not all that
likely to be done, IMO.

I don't think that this exactly qualifies as a bug, but TOS 2.06 (If I
remember correctly) will fail to read a diskette if the first sector or
track is not readable, which is the case with many copy protected games.
The boot sector is some unreadable garbage to make sure people can't copy
the disks, and it also insures that many people can't play their games
either.

I was dismayed to find that most of the games I really wanted to continue
playing on my old MSTE would not load at all due to this problem.

I believe that short sighted copy-protection methods such as this
certainly led to the demise of game development for the ST.

I can't tell you how many games that I purchased, but then couldn't
actually play.

There are instructions for converting a CX-80 to the Amiga, I found them=20
on an Aminet site. Just use this wiring guide for an ST:

pin1 - tp1=20
pin3 - tp2
pin5 - tp4
pin7 - tp3

Have fun!

>I can't understand that everyone says Pure C is better. I have read several
>times that Pure C compile fast but produce some rather crap code.

Depending on what you intend to use the compiler for that can be a
worthwhile tradeoff, though.

PureC is indeed _very_ fast at compiling and it has a very nice source
level debugger.

There's supposed to be a FreeWare (or possible ShareWare) source level
debugger for Lattice C, but I've never tried it.
GCC has GDB, which is powerful but far from user friendly. I'm not sure
if it even runs on the newer machines and OSes (I haven't tried it since
long before I got my Falcon).

The speed of the compiled code is probably not that relevant for what
most people write. Just look at how popular STOS and GFABasic are. ;-)

>I read a very good test made by Johan Klockars between Pures C, Lattice

I have it around still, if anyone's interested.

>and GCC. Pure C was the worst of the 3. Lattice produced some rather
>good code, but made some major faults when trying to optimize. GCC

I emailed HiSoft about those problems several years ago, when they were
still supposedly supporting Lattice C. Nothing ever happened, though.
It's a pity that such a good optimizer is let down by what are probably
very minor bugs in the code generator.
(It doesn't generate erroneous code, it just gets 'de-optimized' easily.)

>was the best overall and Pure C didn't do much more then just translate
>the code as it was into machine code.

If you like using C as a high level macro assembler, PureC isn't too bad.
;-)

>I would say that Lattice C is the best. You get alot of tools and
>up todate libraries (atleast as uptodate as they can get) and very
>good documentation and not atleast, it's in a language you can

A source level debugger is likely to be very useful when you're new to C,
(us oldtimers can get by nicely with printf ;-), which would probably
favour PureC (does anyone know anything about the Lattice C one?).
Porting code from other machines is often a lot easier if you can have
32 bit ints, though, which PureC lacks.

>understand. GCC is also very good if you like the way it works.

Probably not such a good idea for a beginner, though.

That's odd, I've had both versions (still have the old ROMs, too, I think)
and never had any problem reading disks written by 2.05 after installing
2.06 - are you sure it's not another problem, like bit rot?

514. GIF, JPEG scanning service. FREE OFFER! A pictures worth a thousand words! (rrFHpY)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-13 00:00:00 UTC
From: scanning@XXX1324noreply.com
Message-ID: <O1fRGCgG8GA.142@uptgmsnb01>
Source record: 18007

Why don't you print or save this info in case you need it in the future?

Hello Friends,
It's time to take full advantage of the online medium by having your photographs scanned today! Once your pictures are scanned into one of three formats (GIF, JPEG, or BMP) you can do many exciting things with them.

-You'll easily be able to attach them to emails and send them to people your chatting with online. No more having to try and explain what you look like!

-You can also use your photos in all kinds of fun projects: build web pages; design your own greeting cards; make personalized stationary,desktops, and screen savers- the list is endless!

- Scan pictures of yourself, your pet, your vacation, or whatever you choose!

Cyber Services will scan ANY photograph, drawing, magazine clipping, or other artwork to an image file, and email or US mail it (on disk) back to you within 24 hours of its receipt. (You must be able to receive file attachments to get your file(s) via email. Check with your ISP if your not sure.) PRIVACY & CONFIDENTIALITY ARE ASSURED. You'll also receive helpful technical tips on everything from renaming your file to saving time when sending it to people via email.

We scan all our images in 16.7 million colors for best quality. For just $1 extra we can enlarge or crop your photo, blur out a body part, or ad text (such as your name or email address).

Best of all, as a FREE GIFT to you (limited time only), IF YOU CHOOSE TO, we'll reserve you a FREE PAGE (or pages) in our "Internet Date-Site" (Now under construction!!!). This web site contains pages classified by local area and sexual preference. There's also a erotic image gallery (must be legal age to enter), and a "special interests" section. That's right, you can have your own page on the internet for just $4! (Note: You're responsible for answering your dog's email!) Your free page(s) will include any or all of the following: Your scanned photo(s) (You pick which ones- You can have some, none or all of your photos posted on your page), your email address with an icon visitors can click to send you mail, and a brief profile about you. We'll remove or modify your page, at your request, at anytime! When the "Date-Site" opens for business, you'll receive an email notifying you of the address of your personal web page. You can give the address to people and they can view it from any internet
connection! There are millions and millions of people on the internet.It's

time you start meeting them! (This service won't be free for long so act now!)

If you have any questions regarding our services, please call us at (541)744-5718.

Ordering Information:

Price: $4 for first scan, $3 for each additional scan
Extras: $1 each to add personalized information. (name/email)
$1 each to have image modified (enlarged, body part blurred, etc..)
$2 to have image files mailed to you on a floppy disk (IBM or MAC).
$1 credit card processing fee (Visa/Mastercard users only)

If you would like your photographs returned to you please include a self addressed stamped envelope. Otherwise they will be destroyed.

Order Form (PRINT OUT or COPY CLEARLY):

Name (optional):

Email Address or Screen name (PRINT CLEARLY! You must be able to receive file attachments. Otherwise include $2 for shipment on floppy disk.):

Address (optional unless having shipped on disk):

Phone number (optional):

File type (GIF, JPEG, or BMP. GIF recommended):

Extras (Exact personalized info you want printed on scan):

Disk Format (if having mailed on a floppy): IBM or MAC

Payment method (Cash, Check, Money Order, or Visa/Mastercard):
Please make checks payable to Cyber Services.

Credit Card # (credit card orders only):

Expiration date:
Don't forget to include the $1 processing fee if your paying with your credit card.

Do you want the FREE GIFT? Yes or No (circle one)
-Web Page(s) in our "Internet Date-Site" (under construction). You can have a page for yourself, a page for your car, and a page for your cat! Be sure to indicate where you want your page (F4M, M4F, F4F, F4M, or Couples) and which of the following info you want on your page (print clearly): State and Town, email address, year or birth, physical description, quote/message (under 30 words please). Please indicate which photos you want on your page (if any) if you don't want them all to be displayed. If your want your nude/erotic photos displayed in our erotic image gallery YOU MUST include a signed statement that your are over 18 years of age or older and give us

consent to display your nude/erotic photo, and be sure to tell us if your want it displayed with your info or anonymously.

Mail the above information and photos with payment to:

Cyber Services
2852 Willamette St. #131
Department 1
Eugene, OR 97405

Orders sent overnight will be given first priority.

Erotic/Nude photo's will be accepted providing everyone in them is of legal age.

Questions? Call (541)744-5718

Please help our small business grow by sharing this info with someone you think could use it.

Thank You!

(rrFHpY)

Not 100% sure about this, but doesn't TOS 4.0x (Falcon-TOS) support
cascading menus?

: supply an external program that adds the missing features, so no code is
: "waisted" in the kernel for them. Of course, you can argue if this makes
: sense ...

I think it's an odd decision, XMENMGR doesn't use much memory, and there
are a LOT of other things that should be left out of the kernel instead.
Like the awful vfat system...

: And btw., if Lattice C used appl_getinfo() to check whether MultiTOS-style
: submenus are supported, it would be able to use a different method, then. For
: example, Texel does so.

Can't agree more. I guess it just checks the AES-version, which isn't
reliable when you use MagiC which reports AES 3.99.

: And why do you think german programmers wouldn't use Lattice C? I'd say
: that's as true as "Of course, non-german C-programmers use Lattice C".

I don't think there are many german programmers that use Lattice, most of
them use PureC, Sozobon or something like Pure Pascal or even Modula 2...

XMEN_MGR came with v4 and should be placed in your AUTO\APPS folder. It's specifically to fix things like the menus in the editor of HiSoft's development packages, but also programs like Profile v2.xx that use cascading menus.

HDDRIVER supports PC compatible partitions up to 2 GByte if Big-DOS or
MagiC 5 are installed. The demo version of HDDRIVER is available on
acp5.chemie.uni-kl.de/pub/atari/.

> btw? [I have version 2]

Whoops, wrong name! That should read XMENMGR. I've only used MagiC since v4 and it came with that. It adds cascading menu support to MagiC which ASH carelessly left out - probably because the main apps affected were the HiSoft programming ones and of course, German programmers don't use Lattice :-/.

From: Sam Ellis <sce196@ecs.soton.ac.uk>
Message-ID: <Pine.SUN.3.91.970213121709.1425A-100000@davinci>
Source record: 18089

I have just found out that the AS line on the 68000 is a tri-state one, i.e. not only does it have the normal logic high and low states, but it also has a high impedence state (disconnected).

The relevance of this is that the original circuit I proposed about a week ago, may fail under certain conditions, i.e. when AS is 'disconnected'. It would be necessary to also take account of the BG pin (I think?) when determining when to switch from 16MHz to 8Mhz.

BTW, are all 68000's capable of being driven at 16MHz, as some of the documentation I have (some by Motorola) suggests that the maximum speed is 12.5MHz? Perhaps this was so with early versions of the chip, and was improved to 16MHz later?

> which is the very least you ought to be looking at imo.
Mhmm, Lattice C is (IIRC), but Pure C sure isn't fully ANSI. It also lacks
a very important thing almost all other C compilers (including Lattice)
have: 32 bit ints.

Ciao

To be precise, you don't supply an external clock to the DSP with that, but to the CODEC, thus allowing you other sample record and playback rates, e.g. the popular 44.1 and 48kHz. But you still need special software which allows you to supply the CODEC with the external clock for playback rather than the internal one.

Ciao

I've had a similar circuit working in a STFM for three years now, no problems.
I don't test anything except the AS line.

>
> BTW, are all 68000's capable of being driven at 16MHz, as some of the
> documentation I have (some by Motorola) suggests that the maximum speed

> improved to 16MHz later?

Hmmm, this is tricky. Basically some will work @ 16 MHz.

It is often the case that the yield is improved after the process is stabilised.
Sometimes the dies are shrunk as technology improves & the speed increases.

Often the markings are not changed because the chip is old & has been
superceeded by a newer family at a higher clock speed. The manufacturer
wants people to buy the new processor, so they don't announce improved
older devices.

Some of the early accelerator cards used 68000's @ 16 & 24 MHz. I guess
they tested a lot of CPU's to get some to work.

The fastest 68000 I have ever seen is 16 Mhz. Some CMOS versions are faster.

They work in Lattice under single-TOS. They are required to set-up
library paths etc. as well as text markers and window switching. That's
why it causes problems under MagiC. It's not just Lattice that has
these problems with MagiC, but it does seem to be software from HiSoft
that has the most problems (True Paint, True Image).

> supply an external program that adds the missing features, so no code is
> "waisted" in the kernel for them. Of course, you can argue if this makes
> sense ...

It doesn't to me. If MagiC is an enhanced version of TOS it should do
everything TOS does and more. Any upgrade to any OS must leave
everything from previous versions in place for backward compatibility as
well as adding the new stuff. Even Microslop can manage this one. As
soon as 2B start saying "We'll leave that out, no one uses it" they're
making programs incompatible. Anyway, if they're so convinced that the
cascading menus aren't required, why do they include XMENMGR with MagiC
now? I feel strongly about this, having had one of my own programs,
which worked perfectly under TOS, MultiTOS and Geneva, fail when MagiC 4
was released because of stuff that 2B had left out. Luckily, I'm still
around to change and support it, but if I wasn't....
>
> And btw., if Lattice C used appl_getinfo() to check whether MultiTOS-style
> submenus are supported, it would be able to use a different method, then. For
> example, Texel does so.
>
Never, even in my wildest ramblings, would I defend Lattice's GEM
interface. It hasn't been updated in years, even if the libraries,
compiler and linker have. I don't think appl_getinfo() was available

when it was written. Judging from HiSoft's Web site and lack of Atari stuff on it, it probably never will be updated. TBH, it's easier to write the code in a text editor and then use Lattice to compile than to try and use the Lattice editor and its non standard keyboard shortcuts.

> And why do you think german programmers wouldn't use Lattice C? I'd say
> that's as true as "Of course, non-german C-programmers use Lattice C".

OK, that was a wild generalisation. I bet a lot more use Pure C though :-)

A 25.5792Mhz crystal & a 74HCT14N IC a few resistors. You may need to take some power from the port. The most difficult thing is the DB26 connector.

I started a project to add a switch to my FDI to allow for a Word Clock input,

but never finished. :-(

Here's the corresponding pins

For parties interested in the wiring convention used by the cabled connected to the FDI (Falcon Digital Interface) see below:

DB26 (male) DB15 (female)
Pin # Pin #
----------- -------------
1------------GP0-------------8

2------------GP1-------------15

3------------GP2-------------7

4------------P_DATA----------6

5------------P_CLK-----------5

6------------P_SYNC----------4

9------------+12v------------10 measured 11.99v on my Falcon

14-----------GND-------------13

16-----------GND-------------12

17-----------+12v------------9 measured 11.90v on my Falcon

18-----------GND-------------11

* 19----------R_DATA----------3

20-----------R_CLK-----------2

22-----------EXT_INT---------14

26-----------EXT_CLK---------1

I am no way responsible for any damages caused by one using this information to modify or fix related hardware.

Regards,

Rich

>improved to 16MHz later?

The HBS640 runs at 36MHz with a MC6HC000FN16. I was told the
high cost of this card was because all of the CPUs were hand
picked:). At any rate, I have had it run over 40 hours stright
performing operations without a crash or failure.

>
>Thanks,
>Brian
>.

There goes my foot again. I was just thinking of
audio at 44.1. The "players" are not necessarly
sample players. Without looking at all the formats
the following apps handle, they may have to be converted
with 525 or something before being played back. Dirty
Sound Studio has the option to play back with an internal
or external clock as does WAX-D2D and Win Rec 1.41. There
is another that slips my mind, but it will play back an AVR
file from disk (the kind of huge one you get when you copy
a CD track with Extendos) without having to load it to memory.
Raymond, if you read this could you refresh my memory. it was
the one I recommended to you when you said you couldn't play
back the AVR's you were working with. It wouldn't take to much
while on line to convert the sample you get with 525 and then
run it through this app (damn, what was its name:).
Then you could go the programmer route:) But as far as I know,
you have to have the DSP clock set to playback these files
as there is no clock available on the Falcon motherboard that
will match the frequency. Iguess you could do it through software,
but I don't program.....

There are various ET-4000 graphics card projects around (with programmable logic description files). They are in German, which might be a problem, but they give an ISA interface to a Mega ST, then attach a graphics card to the ISA bus.

Try looking on "micros.hensa.ac.uk", in the "Atari" sections. I think there's some stuff in here along the lines of what you want.

Source record: 18013

Hi,

I guess you have a 520STF motherboard. So, it isn't "too much" complicated to upgrade from 512Ko to 1Mo. You will have to buy sixteen 41256-10 (256K x 1bit 100ns).

After openning your ST you will have to find where are the RAM banks. It depends on the revision of your motherboard. For old ST, they are under the keyboard and for the latest ones, they are under the power supply.

You will see that there is sixteen places without components near the populated bank. Here become the hard work : you will have to remove the solder which is inside the soldering holes in order to install the RAM chips. You will have to do that very carefully. The best way is to find a desoldering iron with an included pump.

Once this thing is well done, you will have to install the chips. You should use sockets rather than soldering the chips directly. It will prevent damaging due to excessive heating.

Check all the solders. Take care of shortcircuits made by piece of solder.

The last point will be adding a couple of resistors (sometime, this step is useless since some motherboards already have those resistors in place). I remember that they are 33 Ohms resistors but I dont remember the place where they must be. If you are still interested in doing the upgrade, I will check this and give you the information.

I think that doing this upgrade in this way isn't the best because 41256 chips are quite expensive. Then it isn't easy to do that and there is some risks. To my mind, I think that you should buy a memory expansion board with SIMM sockets that will allow you to upgrade to 4Mo at quite low cost and low risk.

Any opinion from other Atari hardware hackers ?

Hope this helps.

Regards,

Jean-Marie

I agree 100%. If Magic is supposed to be a TOS compatible OS, then it
should support everything (and not drop certain features which they
dont like/use arbitrarily) that Atari implemented.

I can understand them wanting to leave out little used features, but if
these were supported more by a currently available AES (as 4.1 isn't
legally available, strictly speaking...) which supports all these features
(and of course new ones which they come up with) then they might actually
be supported more...

I know it's no help, Mike, but I had it working with my old Supra with no problems. After fiddling around for months, I fninally gave up getting it to work with my Hayes Accura.

I believe Martin Crommie said that the USR has two modes, Fax and data, and once you switch it to fax mode in software, it won't switch back automatically. I don't recall the details, but it sounds like it may be a major problem to use the same modem and phone line for a BBS and fax with a USR.

With SCSI-Tools (Hushi) or HD-Driver you can connect 2 IDE-devices to a Falcon. I have tried with 2 disks (No problem.), now I use one disk and one CD-Rom, still without problems.

This is the misunderstanding. Magic isn't claimed to be an enhanced TOS
-it's a replacement. The areas of difference stem from here and extend to
the statement that Magic v1 preceded MultiTOS and MiNT (not my statement
-it's what I'm told...)

e> Any upgrade to any OS must leave everything from previous versions in

This is not something that MS are given credit for - it's the biggest bone of
contention with them...

542. FS: Atari Computer Goods! Even More Atari Stock! FREE Catalogs!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-15 00:00:00 UTC
From: bensmith@teleport.com
Message-ID: <5e3vvuegs1@linda.teleport.com>
Source record: 18023
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,abg.atari

Check out my Updated Atari Catalogs and find More Atari stuff! I've got Monitors for your Atari 8 Bit like Commodore CM-141 "Like the Commodore 1802" And Disk Drives for the Atari 8 Bit like Stock 1050 and a 1050 Duplicator Drive for Backing Up Software. Plus I've bought out the Game Cartridge Gorf for the 400 & 800 & the Educational Math Game Cartridge Space Journey for any Classic 8 Bit Atari Plus I've cornered the Market on New Copies of Print Shop and some Print Shop related Items! That's Gorf, Space Journey & Print Shop All New Copies, All for the Atari 8 Bit! Plus a Good number of SSI and Avalon Hill/MicroComputer Games, and Many of them are Complete. Plus some Flight Simulator II from SubLOGIC including Scenery Disks all for the Classic Atari 8 Bit. For the Atari ST & newer Computers I've added to my HardWare Catalog Spectre GCR Mac Emulators, Indus (Future) GTS-100X Disk Drives, Panasonic MultiSync Monitor that does Double Duty for both ST Color and MonoChrome Monitors and the Cable/Hardware to your ST Computer. I've also added Software to my ST Catalogs & revised my prices. Titles such as Shrink Wrapped Brand New copies of Ultima V for those of you Ultima Collectors & for you who like Flight Simulators, theirs F-15 Strike Eagle, F-16 Combat Pilot, Falcon, Falcon extra Missions Disk, Fighter Bomber and Flight Simulator II. In Productivity Software, theirs Data Manager ST, Degas Elite, Easy Draw, MultiDesk, NeoDesk, Revolver & PageSTream. All for the ST.

See my Web Page at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. At BSC's Web Page you can View, Capture and even DownLoad Atari Catalogs or Contact BSC by Web Page! Or Request Catalogs by E-Mail. Do You Have problems connecting with BSC's web page? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Please let me know if I can't attach files to your E-Mail. I'll get back to you after the weekend. Catalogs are sent only by E-Mail. Not Snail (Postal) Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports.

You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Page an area for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Home Page! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Page with Michael Currents List of Developers and Others who Support Atari. I am a happy owner of HDDRIVER v6 and I can read PC formatted drive
using MagiC 5 and the EASE desktop...

However, when I use Kobold, it does not reconize the FAT and therefore I
can not use that application.

Does this sound correct or do I have some kind of software conflict?

BTW, I have a TT with 4 meg TT and 4 meg ST memory.

Rich Tietjens previously gibbered to All ...

Hiya Rich...

RT> with no problems. After fiddling around for months, I fninally gave
RT> up getting it to work with my Hayes Accura.

I have just bought an Accura and have it working (after some problems!)
Even with the serial port at 38400 it answers and sends faxes without a
problem, this is receiving through Binkley though.

RT> it may be a major problem to use the same modem and phone line for a
RT> BBS and fax with a USR.

What I had to do was set it to fax mode (in the init string) then get it to
autodetect when answering ... it now works well ...

I did send Mike my init string but I don't think it helped!

The USR is most likely the problem, I had to get rid of my Sportser 14400 to
get fax to work ... they seem to have their own commands!

Dustin,

If it's a Quantum Fireball TM or... damn, I can't remember the other model... he'll have to send it back and get another model (I recommend the current Seagate 1.xx gig models. The Fireball and the other model that I can't remember the name of use arbitration, which the is a major no-no for the Atari. I bought a Fireball TM back in December and tried everything possible to get it to work with no success what-so-ever.

Sorry to be the bearer of bad news, but there it is. :-(

>
>Keith
>.

Keith,

Just for everyone's information, the LANtech carts are no longer being supported (by LANtech). The drawback to the LANtech carts was that they needed an 8MHz ST to run. I also have two or three carts laying around that I can't use because I'm running a 16 MHz MSTE and _that_ would be my host system.

The last time I spoke with Paul at LANtech, he was away from computers and into photography... too bad. He had a great nack for things like that.

Yes, available, but you must have at least 2Mb Ram to use it;
with Mintnet,
* Browser = CAB Crystal Atari Browser
* News & E-mails = Oasis or other like Antmail

But wait for the brand new Web Space from OXO Concept, it will done
everything even without using Mintnet : no sub-layers ... and email,
news, browser everything is inside at a speed you won't believe it ...
Though don't be too enthusiast using that with a simple ST, but it
works !

Your internal clock is manipulated by a program.
Remove all .acc and programs of the autofolder any check again.

If your clock will not show the right time after a new setting.
Reset NVRAM and set the clock to the current time, check time again.
(Next day)

If you can't get the right time after few hours/days, open your F030 and replace
the old NVRAM with a new chip. That chip have a internal Battery. (3.6V Lithium)
You can't replace only the Battery, only the hole chip.

NVRAM it's a big black case under your keyboard, U64 is the correct description.

Watch out!
~~~~~~~~~~
After replace of U64 you falcon lost all video information ect.
You must have BOOTKONF.PRG or somthing from Falcon's userdisk
to set NVRAM-Parameter new!

Take the same chip from BEST or any local electronic dealer.

Use HSmodem 7.0 (or v6.0) and use FASTSER.CPX instead of MODEM.CPX
and you can remap all wanted ports.

But this isn't the same thing. MagiC lacks several features from AES 4.1,
which is the latest AES and what MagiC should support. It's not bad features
either, some of them are realy good.

As this looks almost identical to the Falcon expansion port,
why hasn't anyone done a lowcost Nova card? The descriptions
on how to connect a ET4000 card to the MegaST would be very
easy to use on the Falcon as well so that we doesn't need
to pay that cash for the Nova cards.

Just a thought...

You should get HSMODEM.
It should make the proper serial ports avilable.
The Falcon's 9pin RS232 port is actaully Modem 2.
Sometimes programs aren't really designed to support the Falcon,
so you'll need an auto folder patch to fix things for you.

HSMODEM can be found at ftp.toad.net/umich

Hope this solves your problem...
Brian

If CBHD doesn't recognize them, to my knowledge HDDRIVER combined with
MagiC 5 or Big-DOS are the only way, indeed.

For DOS compatible partitions larger than 32 MByte you need the current
version 3.5 of Kobold. This version recognizes large FATs though it will
use GEMDOS mode on them.

As long as you don't use the Fireball as boot drive and work with a hard disk driver supporting initiator identification/bus arbitration (CBHD, HuSHI, HDDRIVER) the Fireball will work like any other SCSI drive. On the ST with LINK96 host adapter you can even boot from the Fireball because the host adapter hardware supplies initiator identification on its own.

No, the problem isn't with disks written by 2.05. Try some games like The Chaos
Engine or Magic Boy to see what I mean.

It's a pitty that Lattice C isn't supported anymore. There were some talk
about someone else taking over the development and was supposed to fix
most bugs.

It was made by a swedish guy. I think he stopped working on it because of lack of registrations. I think it was supposed to be rather good. I don't remember his name though... mauybe someone could take over development? I think he lived in Stockholm if that helps. ;-)

> Porting code from other machines is often a lot easier if you can have

Hi,

I have heard and read different stories about MagiC and its
so called memory protection.

How is the true story? I have heard several people saying
that MagiC doesn't have any memory protection at all (which
looks to be the truth as it's easy to get "memory block
destroyed" and a reboot as only solution, while MiNT handles
this just fine) but they claim in the docs that they have.

So how is the story? Will MagiC ever get proper memory
protection, or does it already have it, but it just doesn't
work very well or not as it's supposed to?

Anyone?

Sounds like he have removed the jumper on the expansion slot. I guess
you doesn't even get the Atari logo and no programs in the autofolder
are executed right?

Has he installed or removed anything from his computer?

As far as I can tell, MagiC does not have proper memory protection. It's supposed to be improved in v5.04 but is certainly pretty bad in v5.03 (which I have). Proper memory protection can only be implemented on processors 68030 and above or 68020 with a co-processor. Since MagiC also runs on STs with 68000 CPUs, the only way to implement it properly is use the MinT method of having two versions of the executable, one that uses memory protection and one that doesn't. Currently, it doesn't do this, though there is no reason why it shouldn't be implemented in the future. One of the Black Scorpian programmers recently wrote a small program to test MagiC's memory protection. All it did was write to memory that didn't belong to it. Magic crashed.

Regards
Martyn

> Hi
> Got a Atari ST1040STFM and Atari Megafile 20 (20MB Atari Harddrive).
> It starts to boot and displays a boot-up message, but crashes with 3
> bombs. Anyone got any ideas?

at least two
1)When you see the boot up screen, hold down the Alt key until the desktop appears,
best to have a floppy disk in the disk drive, speed things up a bit), then install
the hard drive C partition via the menu bar above the desktop. - install device/hard drive
double click on the hard drive and check out the "auto" folder.
2)put a floppy in the disk drive with ahdi.prg, hdx.prg (or other hard drive
boot/configuration
programs. turn on the Atari, wait till the desktop appears. turn on the hard drive.
try to boot the hard drive with ahdi.prg. If successful, install C drive from menu
selection
(If you get a Cartridge, you weren't successfull in booting the hard drive)
check out the auto folder by moving everything from it and then copying/moving prg's back
to
it one at a time and in the order you would like them to boot in. Better yet, buy XBoot!

> Can someone also tell me an ftp site for Atari PD/shareware software
> etc please?
> Please email me because I dont read this newsgroup
> Thanks

I once wrote an article for GEnie Lamp explaining how to do the
conversion. My process, however, IMHO, was NOT better than an Atari
mouse. The CX-80 was a device designed for the 8-bit Atari and required
a ton of mouse acceleration to be usable after my hack. Wish I had a
copy of the article handy to pass around. I still have it at home on
floppies somewhere but it's not really worth doing.

What about just lower the speed on the fan (rpm)? I think it should
do the trick and still cool the computer enough. I think someone
had done this with a regular resistor.

I am looking for the MIDI file format -- a friend of mine is writing a program for his 3rd year project at Uni that composes music, and he wants to be able to listen to it. So we're looking for the MIDI file format so we can get it onto my Atari.

There's probably a better place to post a request for this, but I thought I'd try here first.

Cheers,

James Cox

Hi, I just disconnect the fan, it makes less noise for sure, I did
that coz my falcon is open, so no problem with heat.
Hwever you have to know that the conner has a very annoying sound as
well, so the falcon still make noise. :/ .

Phil:
This may or may not be useful, but you could do your work on just about _any_
spreadsheet (Atari Works?) and export/save it in ascii delimited(comma or
space or...) format for importation into Lotus. Notice I said _import_, not Open!
I think other *old* spreadshets like Masterplan could save in Lotus *.wk1
(or 2?) format, but I don't know how useful that would be!
There may be other possibilities also, such as Texel, Twist, etc which I really
couldn't comment on.

583. Reducing Falcon noise

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-18 00:00:00 UTC
From: alkio@hkkk.fi
Message-ID: <5ecco2$8bu@ankka.csc.fi>
Source record: 17964

Hi,

I have recently bought a Falcon 030. I use it mainly for music and since I am accustomed to my old quiet STE I find the fan noise quite a bit annoying. I know that most of the noise comes from the fan - I tried shutting down the HD but it didn't really affect the noise level. (Btw, I have the internal Conner 84mb HD)

So, there are three options (I think).

1) Disconnect the fan alltogether. Has anybody done this succesfully without any problems? Has anybody done this WITH problems afterwards? This would of course be the cheapest and quietest way if the Falcon could safely handle it...

2) Fan regulator. I read some german docs about installing regulation circuits for the fan. I didn't really understand it completely since my german is far from perfect. Has anybody installed some kind of regulation (or a completely new regulated fan)? Does it take down the noise and is it expensive or hard to build (I do have some experience with hobby electronics)?

3) A new, quieter fan. I just don't think that this would help things much... Of course, I'd be glad to know of a replacement fan if it really is noticeably quieter...

Greetings, Jouni Alkio

I have a C reference which states that ALL microcomputers use 16 bit
ints. Admittedly it's a bit dated, but I suspect that using 32 bit
ints will hurt you more than help you w.r.t. portability.

Well, I'm in the same boat, and my solution was to get a keyboard kit
for the Falcon and mount the CPU in a three sided box. The side facing
away from my audio recording area is open. It's not perfect, but it
works..

588. Mefa ST 2 anatomy (question)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-19 00:00:00 UTC
From: ut13@rzstud2.rz.uni-karlsruhe.de
Message-ID: <5eeeqmhrs1@nz12.rz.uni-karlsruhe.de>
Source record: 17969

Hello.
Is anywhere on the net or (in a book I could find) information about the
Atari Mega ST 2 from inside? I have opened it, because the ventilator
doesn't work, and I see some empty places for new circuits. I am curious to
know what is it all. Is there a description?
I also wanted to find an ethernet adaptor, but I see that i would have to
find an ACSI to SCSI converter (where are such things available), and at the
end it would be cheaper to by a PC... I don't have also the knowledge.
Greetings,
Guentcho

I wantet also to connect a greater hard disk to the Atari. I see that a lot
of people have done it, but I haven't seen a whole solution.
Bye.

Maybe it is but on my 520ST I had to piggyback the chips since there were no extra sockets. If that is the case you will have to take an extra CAS and RAS (I think its a long time since I did it) from the MMU.You could also go the whole way and install 4megs (simms), but its recommended that you are quite good with a soldering iron.You don't need any special ram upgrade boards (i've done it myself and it works like a charm)

Hello Phil

: Does anyone know of a spreadsheet that works on the TT that can read
: and write LOTUS 123 release 5 files.

LDW power falls over on the tt (in all resolutions). Backward doesn't fix
the problem either.

I've been looking for LDW power 2 to see if it will solve the problem, but
so far to no avail.

Best wishes

As long as you disable the parity jumper then almost any SCSI controller should
work with it <not guaranteed>.

Take Care, Miika

594. TOS 2.06 chips to replace TOS 2.05 in MegaSTe

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-19 00:00:00 UTC
From: Ken Macdonald <macdonald@cfcsc.dnd.ca>
Message-ID: <330B536A.620F@cfcsc.dnd.ca>
Source record: 17975

I had TOS 2.06 in an old STf which had to be removed for various reasons,
and replaced with TOS 1.04.
I now have a MegaSTe with TOS 2.05, and was wondering if I could use the
TOS 2.06 I removed from the STf.
If it helps, I have the numbers on the TOS chips, which are four(4) in
number. (although there is a fifth chip, I am not sure if it is a TOS
chip)
1)
8627QPP
AM27512DC
1983 AMD
(G358586-7)

2)
AM27512
-25DCB
8742GP
1983 AMD

3)
AM27C512
-255DCB
014I2VB
1986 AMD

4)
AM27C512
-255DCB
014I2V3
1986 AMD

Some of these chips seem to have a clear window in the top,
with another smaller chip visible inside the window.
Are these even legit chips???
Thanks for any help/info

Simplistic solution (but not enough). I know they're less than US$50, (compdirect)but my question was aimed to know about the electronics behind the audio hardware.

Since the frecuency at which the hardware is clocked is far higher than 50Khz, it would be interesting to sample audio several times higher this frecuency. For people who understand the way digital sampling works it would make a lot of sense. The question is still there : Where do I find technical information, diagrams, service manual, etc about Falcon.

Best regards: Phill.

> It would be indeed! Couldn't you tell us a bit about your idea, Rich?
> ---

Chris, Rich was kind enough to e-mail me with details, and I've posted it below (I'm sure Rich won't mind).

It seems fairly clear what needs to be done to achieve it, but I don't have the knowledge or ability to do it myself.. anyone? You could make some extra money modifying people's FDIs.

Well after opening the CAC there is simply a crystal (to give CAF a 44.1KHz
sample rate) an IC and some resistors. One would have to take the Word Clock signal and change it to what the Falcon needs. Since I have an FDI,
I don't need the CAC.

But how to change the Word Clock? in fact what are the specs for Word Clock
I do know something about it being TTL level etc...
These are the frequencies that the Falcon needs to get 44.1, 48 etc..

Master clock Divisor(n) Bit Rate Sample Rate

25.175 MHz 4 6.29375 MHz 49.17 KHz (50KHz)
22.5792 MHz 4 5.6448 MHz 44.1 KHz (CD)
24.576 MHz 4 6.144 MHz 48.0 KHz (DAT)
32.000 MHz 4 8.000 MHz 62.5 KHz

Now the trick is to get Word Clock to a MHz freq and then just put in a switch where the new signal will replace the internally available sample rates.

After getting confused I got a Z-1SRC Sample Rate converter that locks to
Word Clock, also Ardvark? makes a master Word Clock generator.

It seems simple enough though.

Here is a file on the audio matrix of the Falcon. The last part has a pin out (of the DSP) to the Steinberg DB15, in case your cable gets

damaged.

Overview Of The Falcon030 DSP & Audio System
(from documentation by Atari Corp. dated October 1, 1992)

The Atari Falcon030 contains a sophisticated digital processing and audio
sub-system...

32 MHz 56001 Digital Signal Processor with 96K bytes of zero wait-state SRAM.

Eight track, 16-bit digital DMA record channel.

Eight track, 16-bit digital DMA playback channel
(operating in parallel with digital record).

On-board 16-bit stereo DACs, feeding the internal loudspeaker and headphone
jack.

On-board 16-bit stereo ADCs, and stereo microphone jack. Sophisticated data
path matrix between DSP, DMA, Codec and external connector.

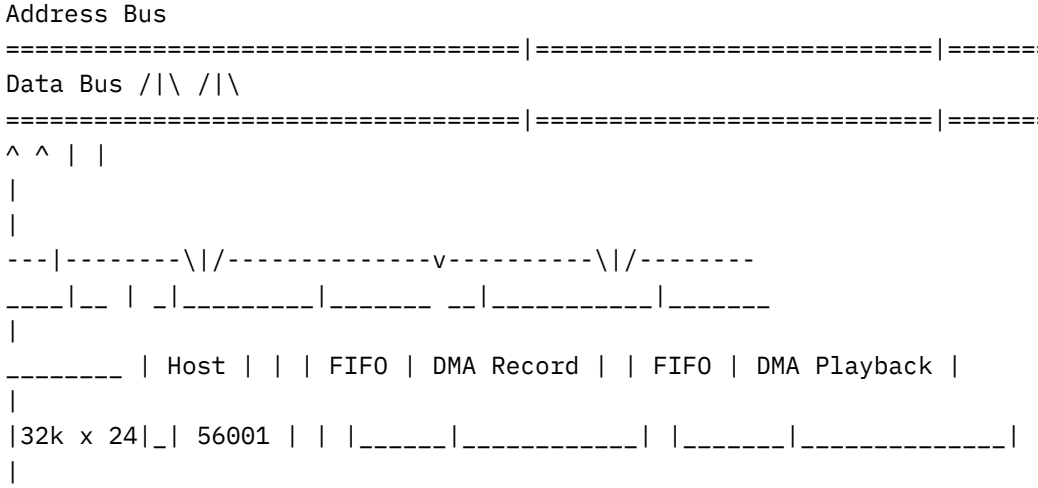
Sample rates up to 50KHz.

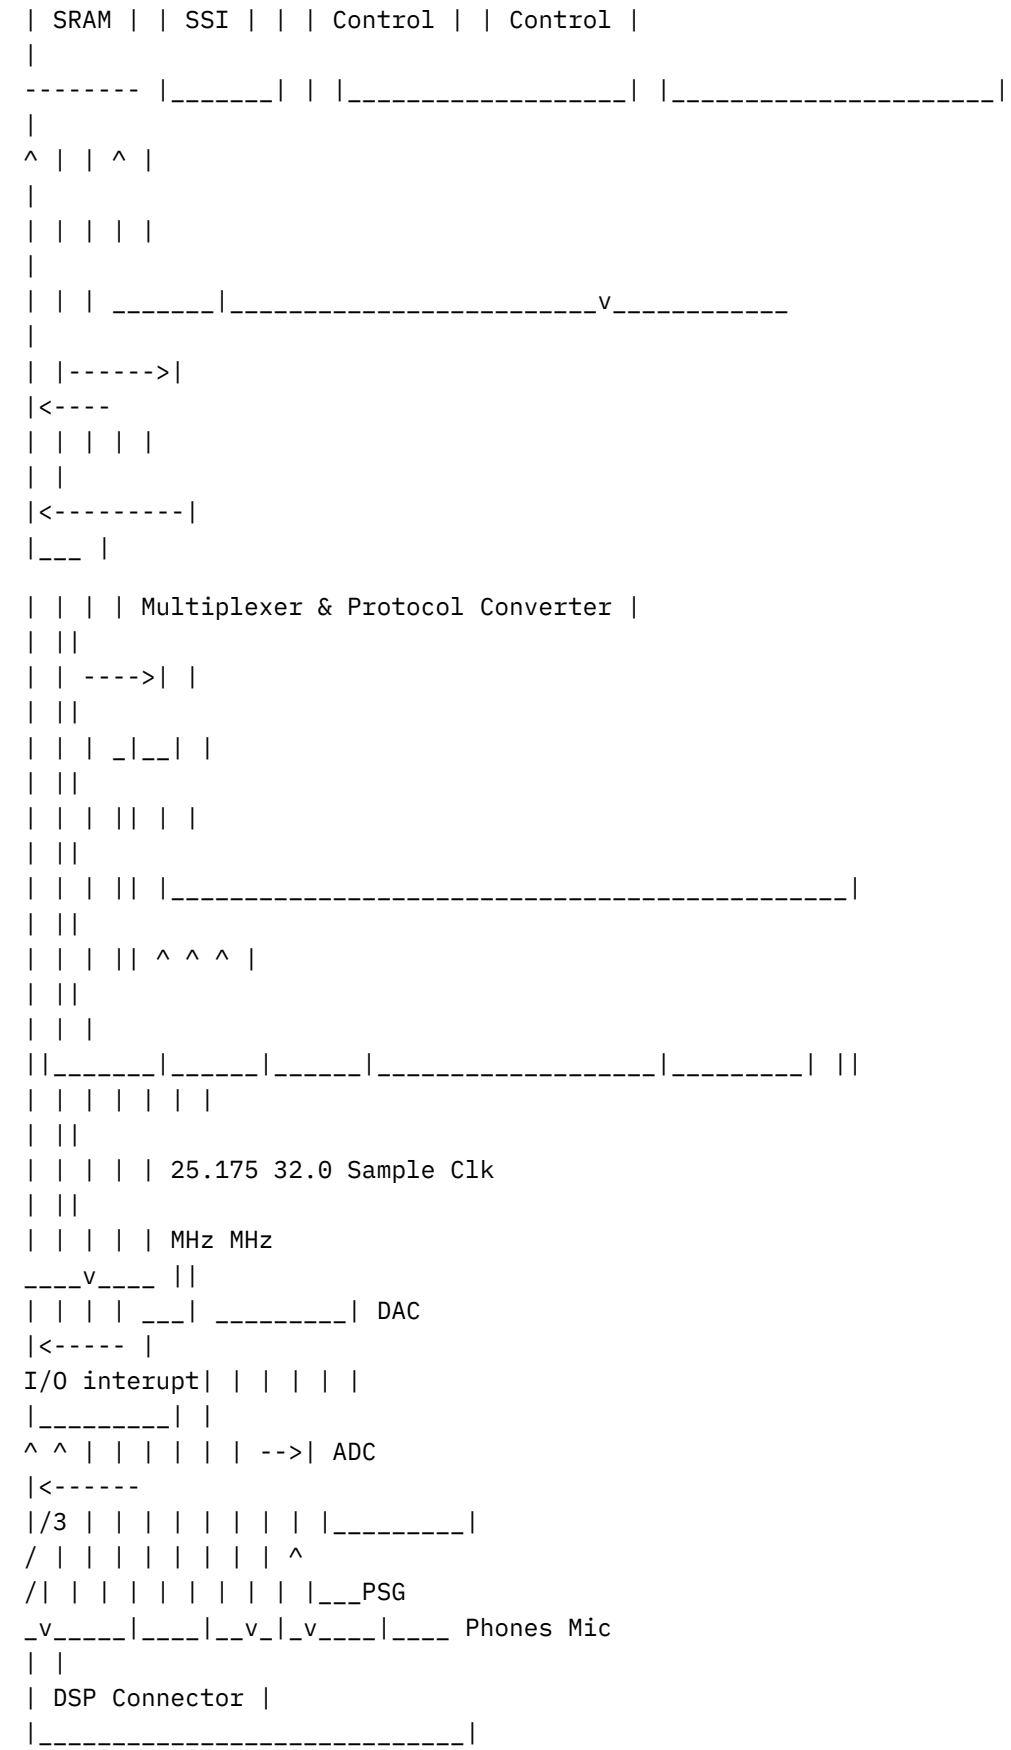
Serial data transfer rates up to 1MByte per second.

Loudspeaker or headphones can monitor any stereo channel of 8 track digital
playback data.

External serial record and playback channels connect to industry standard
DACs, ADCs and S/PDIF components with minimum additional logic.

The block diagram on the following page describes the Digital processing
sub-system.





| SRAM | | SSI | | | Control | | Control |
Multiplexer & Protocol Converter
25.175 32.0 Sample Clk
MHz MHz
DAC
I/O interupt
ADC
PSG
Phones Mic
DSP Connector

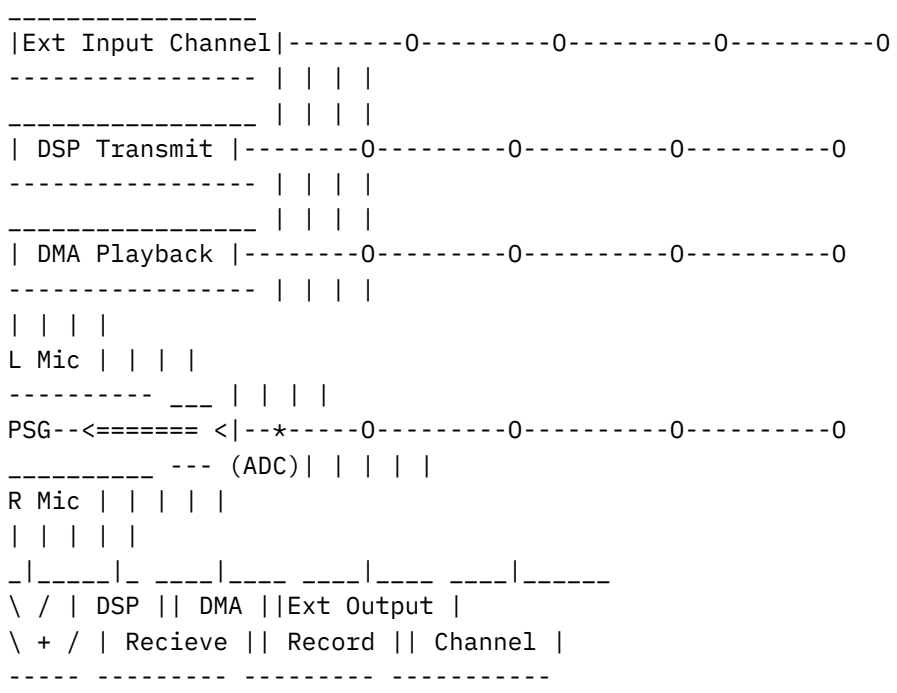
The digital processing sub-system has many features which make it ideal for
audio processing. However, the data being processed can also be video (images), graphics objects (3-D image manipulation) or any other general purpose data.

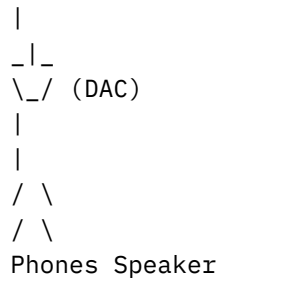
To maintain the maximum flexibility, the Atari Falcon030 provides an extremely general connection system between these components. All data transfers are in a synchronous serial format. Any component can talk with
any other. Since some of the components have real time response requirements,
the clocking schemes have also been made especially general and flexible.

Communications
Any two devices in the sub-system can talk with each other. To allow them to
talk you need to connect them together correctly. This requires several things:
1) Connect the two devices (a receiving device to a source device)
2) Select the source clock
3) Select the communication protocol (handshake or continuous)

Connections
There are four devices capable of sending data and four devices capable of
receiving data. To allow any connection therefore requires a four by four
matrix:

Source Device

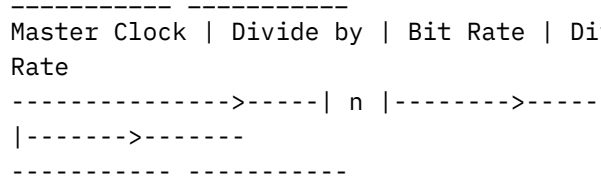




Each receiving device can have its data path connected to any one source device. Source devices "source" data. For example, the ADC represents data
from the microphone jack so the ADC is a data source. It can send it's data
to any (or all) receiving devices. See the "Devices" section for more details.

Clock Sources
All the data connections shown above, are actually serial data paths which
include a bit clock, data, and synchronization signal.
There are three possible clock sources in the system:
Internal clock (25.175 MHz)
Internal clock (32 MHz)
External clock

Each source device must select one of these clocks as its master clock. The
Codec can only use the Internal 25.175MHz, or External clock.
The bit clock is taken from the master clock divided by a programmable value
of 4 to 24 (in increments of 4). The Sample rate is then the bit rate, divided by 128:



Since the bit rate is 128 times the sample rate, there is room for eight 16-bit samples per sample period.

Master clock	Divisor(n)	Bit Rate	Sample Rate
25.175 MHz	4	6.29375 MHz	49.17 KHz (50KHz)
22.5792 MHz	4	5.6448 MHz	44.1 KHz (CD)
24.576 MHz	4	6.144 MHz	48.0 KHz (DAT)
32.000 MHz	4	8.000 MHz	62.5 KHz

The internal 25.175 MHz clock is used to support STE compatible 50KHz, 25KHz,
and 12.5KHz sound sample rates. (Note that the built in DACs do not actually
support a 6.25KHz sample rate)
The internal 32 MHz clock is useful since it can be used to provide an 8 MHz
bit rate (or 1 Megabyte per second), which is the maximum transfer rate of the
DSP SSI interface.

The external clock comes from the DSP connector. It can rnn up to 32 MHz.
Some useful external clock rates are shown below:
22.5792 MHz gives CD rate of 44.1 KHz
24.576 MHz gives DAT rate of 48.0 KHz

Communications Protocols
Data sometimes gets lost. We all do it. Even a piece of perfectly well designed hardware can do it. The maximum data rate of the DMA record or playback channels is 1 Megabyte per second each. Since the FIFOs are 32 bytes deep each sound DMA channel will require bus access approximately every 32 microseconds.

Unfortunately, poorly written software can create situations where this access requirement is not met. A combination of other devices may lock out
the bus from sound DMA, particularly, badly behaved expansion port devices
and true color video.

If the data is sound data and it is not critical, then an occasional overrun
or underrun may be acceptable. If the data is JPEG video, DSP object code,
or any other non redundant data, then you wlll want to guarantee it is never
mislaid.

For precisely this purpose our system includes a special handshaking mode
which prevents overrun or underrun. When in handshaking mode, the data rate
can be variable since timely bus access cannot be guaranteed. This also means
that in handshaking mode there is no concept of a sample rate, or left and
right tracks, or multiple tracks at all. The data is simply transferred one

word at a time as quickly as the source and receiving devices can communicate.

If timely bus access can be guaranteed it is better to use continuous mode.
Continuous mode should be used for any real time applications (such as sound
playback or record), and it will generally be more effictent for the DSP since
its interrupt routines can be faster.

Devices
There are a total of four devices in the audio sub-system, each of which are
full duplex. In other words, we actually have four data sources and four data
receivers:

Device	Data Source	Data Receiver
DMA	DMA Playback	DMA Record
Codec	ADC	DAC
DSP	DSP Transmit	DSP Receive
External	Ext Input	Ext Output

These devices can be connected together in a very flexible manner (as shown
in the matrix under "Connections" earller in this section).
Each device has its own special characteristics, which are described below.

DMA Input
The DMA input channel provides a fast path to system memory. Briefly, it
includes a 32 byte FIFO on the data path synchronized with a memory addressing
module which can fill memory in a linear, continuous or looping mode. The
maximum data transfer rate is about one Megabyte per second.

The data and clock signals to DMA input must be synchronized. Source devices
can send data to DMA input in either handshaked or non-handshaked modes.

In handshaked mode DMA Input must be the clock source. It uses a gated
clock technique to stop data transmission if its FIFO becomes full.

In non-handshaked mode, DMA input receives a clock from the sending device.
When its FIFO becomes half full it will attempt to write it to memory. If it
cannot get access to the system bus in time, data will overflow.

Non-handshaked mode to DMA input is provided simply because it puts less
burden on the sending device. However, when using it the user must be careful
to limit the data transfer rate to within system bus bandwidth limits.

DMA Output
The DMA output channel provides a fast data channel from system memory
to
sub-system devices. It also has its own 32 byte FIFO which helps ensure
that
it can keep up with the real time response required by certain devices
(such
as the Codec DACs).
Data transfers can be done in either handshaked or nonhandshaked modes.
In
handshaked mode a gated clock technique is used together with a flag
signal
from the receiving device to prevent overrnns or underruns.

Non-handshaked mode is normally used for communication with DACs or
other
real-time devices. If the system bus becomes overloaded for any reason
with
higher priority bus masters data may be lost in non-handshaked mode.

As usual, the receiving device must be using the same clocks and
protocol as
DMA output to ensure correct data transfer.

Digital Signal Processer (DSP)
The Atari Falcon030 includes a Motorola 56001 Digital Signal Processor.
This
part offers the following features:

32 MHz operation, yields 96 MOPS.
1024 point complex FFT can be done in 2.07 imlliseconds.
24 bit internal and external data paths, yielding 144 dB dynamic range.
56 bit accumulators.

The following operations can be executed in parallel in one instruction
cycle:

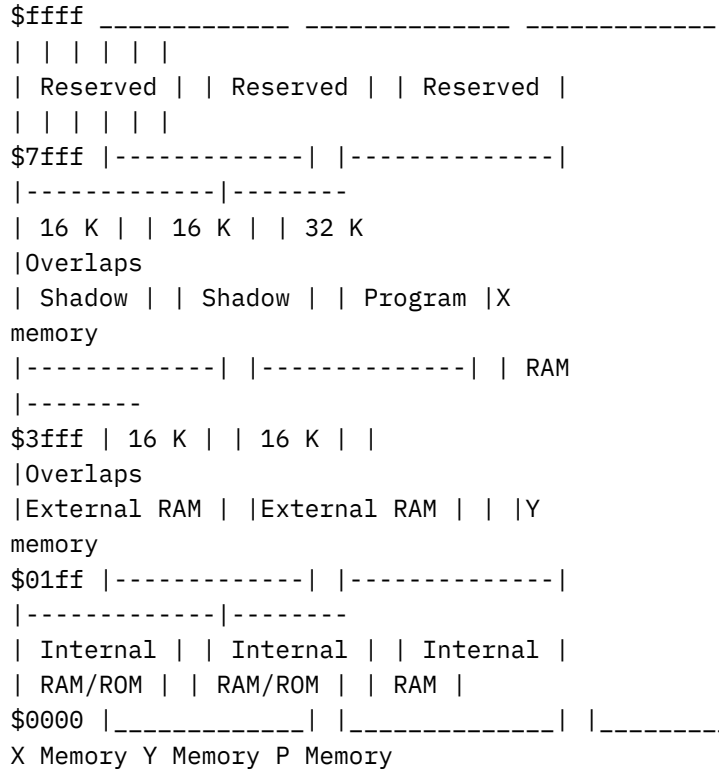
24 x 24 multiply
56 bit addition
Two data moves
Two address pointer updates
Instruction prefetch
1024 x 24 bits of on chip RAM.
512 x 24 bits of on chip ROM used for Mu-Law, A-Law and four quadrant
Sine
wave table data.

DSP Memory Map
In addition to the on-chip RAM and ROMs there are 32K words of external,
zero
wait state SRAM. The memory map is conflgnred as follows:

Program space is one contiguous block of 32K words.

X and Y data space are each separate 16K word blocks.
Both X and Y can be accessed as blocks starting at 0 or 16K.
Program space physically overlaps both X and Y data spaces.

Note that since program space overlaps X and Y space DSP software must
be
careful to avoid having program and data memory corrupt each other. Note
that
X:0, X:16K and P:16K are the same physical RAM location, and that Y:0,
Y:16K
and P:0 are also at the same physical RAM location.



SSI Interface
The Atari Falcon030 brings out the six wire SSI port to the external
DSP connector.

Host Port
Interface with the 68030 host is via the 56001 host port (port B). Data
transfer by the host is via programmed I/O. In other words, the DSP host
port
appears in the 68030 memory map as eight byte locations, Data transfers
by
the host should always be conducted thruogh the appropriate operating
system
calls (see the Atari Falcon030 software developers guide).
DSP software transfers data to and from the host port in the usual way
(see
56001 DSP Users Manual). The host can interrupt the DSP and vice-versa.

SCI
The 56001 three wire SCI port is not implemented in the Atari Falcon030.
DSP
software must not rely on the existence of any of the SCI registers,
including
the SCI timer, interrupts, or control and status registers. Various
versions
of the Atari Falcon030 may or may not even include the SCI circuitry!

DSP Expansion Port
This DB26 female connector includes a variety of signals designed
primarily
for the connection of digital sound devices and modems. It can (and
almost
certainly will) be used for a number of other appllcations such as low
cost
laser printers, video digitizers, scanners and so forth.
The pinout is as follows:

DSP Connector, DB26, three row female:

Pin# Signal Pin# Signal Pin# Signal
---
1 GP0 10 GND 19 R_DATA *
2 GP1 11 SC0 20 R_CLK
3 GP2 12 SC1 21 R_SYNC

STD I/O DSP SSI port Pin STD (PC8), Transmit data

XO_DATA O External Serial Output, serial data
XO_CLK O External Serial Output, serial clock
XO_SYNC I/O External Serial Output, Sync

XI_DATA I External Serial Input, serial data
XI_CLK O External Serial Input, serial clock
XI_SYNC I/O External Serial input, Sync

EX_CLK I External master clock

+12v- +12v power. Do not draw more than 300mA on this pin.

The signals on this port include several high speed clock and data lines. It
is therefore essential that developers use correct drive and termination. In
general, all signals should be terminated with a ferrite bead followed by a
68ohm resistor in series. This is the same type of termination used inside the
Atari Falcon030 on all DSP port signals. A ferrite bead should be chosen that
does not begin cutoff until 20MHz to 30MHz. Input signals from the peripheral
should be driven by CMOS devices such as 74HCxx or 74HCTxx.

Total cable length should not exceed 24 inches and we strongly advise the use
of twisted pair cables.

General Purpose Bits
Three bits are provided for general control purposes. They can be set, cleared or read as inputs through the operating system. At reset these three
lines are programmed as outputs and driven low by TOS.

DSP SSI Interface
These six pins are the SSI port from the Motorola 56001 DSP chip. The serial
clock can operate up to one quarter of the 32 MHz DSP master clock rate, or
8MHz. To use these pins to talk directly with the DSP you need to take care
to avoid contention with the communication matrix by tri-stating the communication matrix outputs through the appropriate OS call.

External Serial Output channel
This three wire serial interface can be used to transfer data from the host
computer. It can transfer data from the DSP, DMA playback channel, or on board analogne to digital convertor.

Data transfers use either continuous mode or a handshaked (gated clock) mode:

Signal Continuous Handshaked

XO_DATA Output Output

XO_CLK Output Output
XO_SYNC Output INput

In either mode, data changes on fhe rising edge of the clock. Data should be
sampled on the falling edge of the clock.

In Continuous mode there are 128 clock cycles per sample period. XO_SYC will go
high for the first 16 bits of a sample period and then low for the remaining 96
bits. In each sample period a maximum of 8 tracks of 16 bit data can be
transferred. Data words are transmitied MSB first, end-on-end, with no gaps in
between them. The number of words per sample period is determined by the
source device.

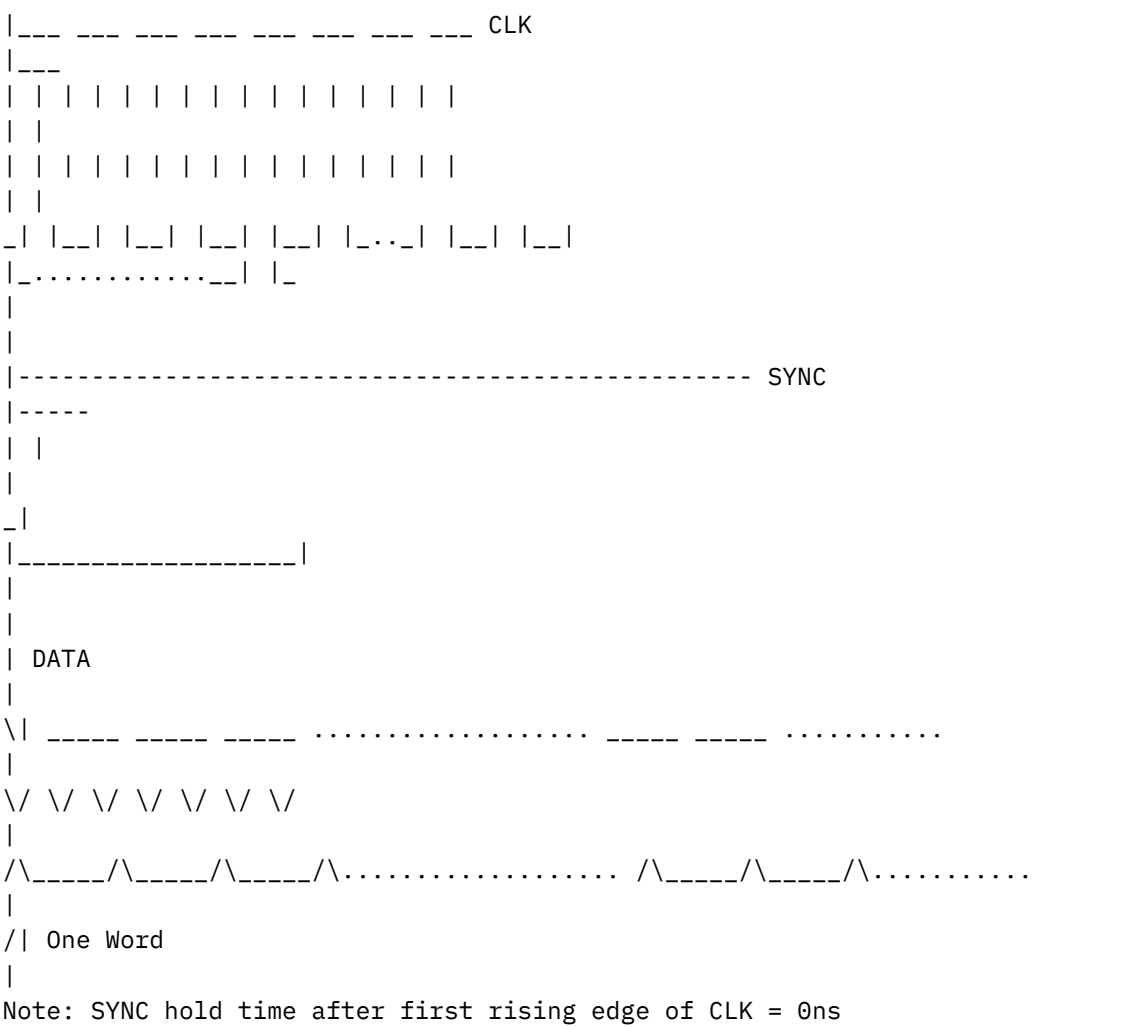
A typical sample is shown below:
128 Clock Cycles

```
================================================================================
```

DATA & SYNC change on rising edges of CLK & should be sampled on failing edges of CLK

In Handshaked mode XO_SYNC becomes an input. The external device will pull
XO-SYNC high, and if the source device is ready, XO_CLK will become active
for 16 cycles (or one word) together with XO_DATA. XO_SYNC is sampled by the
source device at the end of each word. If XO_SYNC is high and another word is
ready to be sent, XO_CLK and XO_DATA will become active for another 16 cycles.
A minimum of two clock periods will always be inserted between data words.

This gated clock technique wlll prevent overrnn or underrun at either end of
the data paths:



Note: SYNC hold time after first rising edge of CLK = 0ns

==========

External Serial Input Channel
This three wire serial interface can be used to transfer data to the host
computer. It can transfer data to the DSP, DMA record channel, or an on board
digital to analogne convertor.
Data transfers use either conimuous mode or a handshaked (gated clock) mode:

Signal Continuous Handshaked

XI_DATA Input Input
XI_CLK Output Output
XI_SYNC Output Input

In continuous mode it is the responsibdity of the external device to
synchronize to the XI_CLK and XI_SYNC outputs. Data should be changed on the
rising edges of XI_CLK since it will be sampled on the falimg edges. XI_SYNC
will identify the start of a frame by going high for the first 16 clock
cycles, and then low for the remaining 96 cycles.
In handshaked mode the protocol is basically the same as for the external
serial output channel, except that XI_DATA is an input. When the external
device has no data to send it must pull XI_SYNC low at least one clock cycle
before the end of the previous sample.

External Master clock
This clock can optionally replace the internal 25.175 MHz or 32.0 MHz
clocks.
The maximum frequency allowable is 32 MHz.

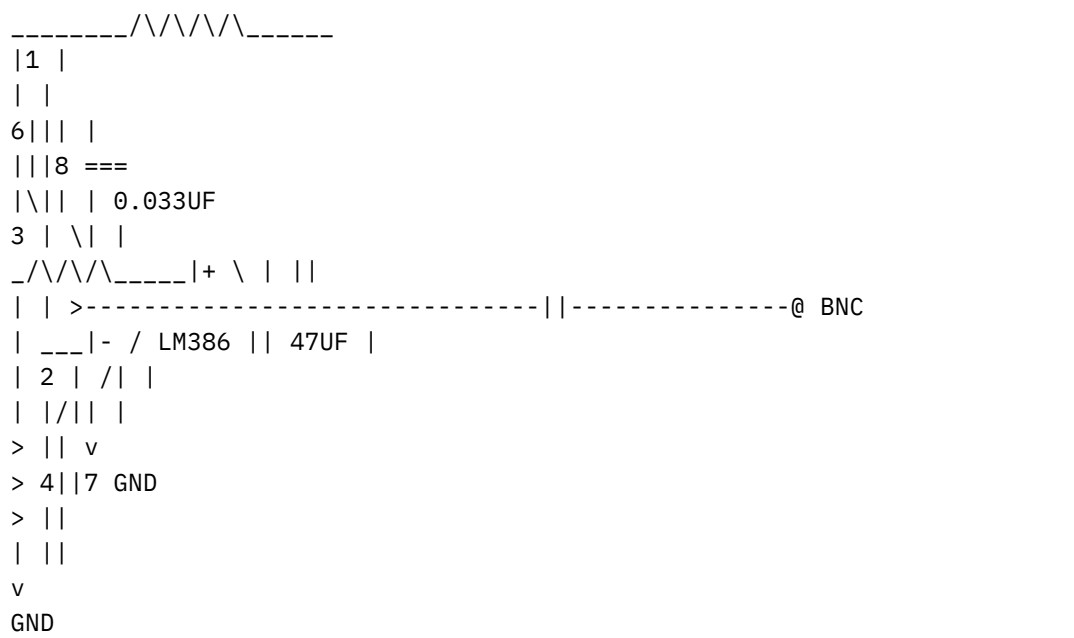
CODEC

The Atari Falcon030 on board Codec is a high performance, 16 bit, stereo
device. It includes a stereo DAC and stereo ADC.

16-bit Stereo DAC
The DAC output is directed to the on board loudspeaker (which can optionally
be turned off), to the monitor port (for monitors which have loudspeakers
built in, such as the SC1224), and the stereo headphone jack on the back
panel.
DAC attenuation can be controlled for lefl and right channels independently,

through operating system calls.

Stereo Headphone Jack
The output port is a voltage drive with a peak voltage level of 3v, and
an
RMS level of 2v. It is designed for a peak load of 0.25W; this means
that
the load should have an impedance greater than 32ohms.



To help compensate for the poor low-frequency response of headphones and
small speakers, the headphone amplifier has had a bass-boost circuit
added
to it which adds about 6dB to the output level, centered at 100Hz,
dropping
to a 0dB boost at 1KHz.

The power level present at the headphones is dependent on the level in
the
input signal and the output impedance. If the input (digital) value is
assumed to be a 16-bit value scaled between +/-1, then power level on
the
headphones is:
Vout = 3*IN
Pout = [(3*IN)*(3*IN)]/XH
Where XH is the headphone impedance. For example, for 32ohm headphones
the
peak output power is:
Pout = 0.28 * [(INmax)*(INmax)]

The output is AC coupled by a 47uF capacitor. This means that there is a
roll-off in the frequency response at low frequencies. The cut-off point
can
be approximated as:

Fcut-off = 1/(2 * 3.14... *47uF *XH)

Where XH is the impedance of the headphones. For example, with 32ohm headphones the cut-off is at 105Hz.
Note that the headphone output is a voltage. While the output is somewhat
higher than normal line levels, output attenuation in the Codec can reduce
this without loss of dynamic range. At the normal "llne" impedance of 600ohm,
the cut-off frequency will be lower; other internal limits keep the system
to a cut-off of about 30Hz.

Internal Loudspeaker
The internal speaker is driven from a boosted op-amp. It is capable of output
levels of 2v RMS (3.5v peak), and can drive loads as low as 8ohm. This means
that the RMS output level is 0.5W. Peak levels will clip at 1.5W.

Yep, that _is_ a bit dated. as far as I know GCC uses 32bit ints by default,
and most "modern" compilers also do so... Some systems at my University even
use 64 bit ints!

BAD. The fan keeps cool the system so the transistors won't get
into the dangerous "avalanche state" (current generates heat, which drops
the internal resistance of the transistors and this process continues
until the device is destroyed in a noisy short circuit.

Just think: Atari wouldn't have placed a fan there is it were
unnecessary.

>2) Fan regulator. I read some german docs about installing regulation
>circuits for the fan.

If so, it must have a fast response to heat.

>3) A new, quieter fan. I just don't think that this would help things
>much... Of course, I'd be glad to know of a replacement fan if it
>really is noticeably quieter...

Actually is a good idea. The problem is to find a low decibel
noise fan and they're scarce/expensive.

We feel the noise because we have the whole computer right in
front of our faces. (and we're used to the quiet ST). If you're thinking
in upgrading , I would consider getting another case and an stand alone
keyboard. (option 4;)

Buy a simple cheap "fan-regualtor", controlled by an
temp. driven resistor. Your fan will still work slow.
Your cpu warm up, the fan speeds up too.

A chance to reduce the noise to a level of 20%
(With allways a cool machine)

I tried that, but beware. It works well for an hour or so and then the fan may stop unnoticed. Or the fan does not start the next time.

I now use a 7808 IC to lower the voltage from 12 to 8 V. That works.

>could safely handle it...

Last night I opened my Falcon and turned it on without the cover. I
noticed that the fan didn't really produce any noticeable airflow at
all! And it is not located in a very effective place either.

So, I did a radical thing and cut the power wires that go to the fan.
So now my Falcon is quite quiet - the internal Conner 84MB HD does
make some noise but it is certainly bearable.

I can always connect the fan power again if I start to notice problems
which could possibly be due to overheating. I just hope that my Falcon
doesn't break down suddenly. But I doubt it since I don't think that
the fan was very effective in the first place!

Greetings, Jouni

> and most "modern" compilers also do so... Some systems at my University even
> use 64 bit ints!

It has probably been said already, but I always try to follow the golden
rule for portable code: "Never assume the sizes of data types"

And as to whether an integer should be a particular size, I fall back on
what Kernighan (sp?) and Ritchie said in "The C Programming Language
(Second Edition)" : An integer should fit the natural word size of the
machine. (I've lost my copy of the book, so this quote may be a little
fuzzy).

To me, "natural word size" refers to the ALU (Arithmetic & Logical Unit)
width of the target processor, so an int would be 16-bits on a 16-bit CPU
like the 68k, but 32-bits on a 32-bit CPU like the 020+ CPUs. DEC Alpha
systems would use 64-bits as the "int" size, as that is the size of the
Alpha ALU (and the Alpha can only deal with 64-bit integers - smaller data
has to be loaded, masked, and optionally bit-shifted into the correct form
that the ALU can deal with natively)

(CPU's work fastest when using ALU-width data. Smaller or larger data is
slower to deal with, and more likely to generate errors)

For a 68000 or pre-386 CPU this would mean 16-bit.

For a 68020 or 386+ processor, this would be 32-bit.

But the compiler writer is free to ignore this.

I have a Mega STe with TOS 2.05. It works just fine.
I thought I'd see what 2.06 did.
I soon went back to 2.05.
I couldn't run self booting games at all. 2.05 lets me run some of them
at least. There were a couple of other things that I can't remember now.
Stick with 2.05. It works ok.
If it ain't broke, don't fix it.

Most of the shareware support is done on the Mac.. which also doubles as my premier Atari machine. However, last night I could not switch it on. :(

I am going to get this fixed but am not sure how long it will take.

Due to the way CyberSTrider now works, this will not affect any registrations.. people will still receive them. However, the databases will not be updated until I can get the machine fixed (last backup was over 3 weeks ago). Other than that, I will have to manually go through all registrations received since the last backup and enter them manually which I don't have time to do... articles etc take priority for re-writing.

Rest assured, people will still receive registrations without any delay. :)

From: please@no.spam.mail.here
Message-ID: <29788_please@no.spam.mail.here>
Source record: 17851

Having just spent 80 quid getting a blown up Pioneer 6 disk CD-ROM player repaired (CDR-600) , can anybody help?

I'm using HD-DRIVER 6 and Extendos Pro 2.4 , I CAN'T get extendos to recognise more than disk 1 in the caddy.

I'm using the suggested config of X:7.0 Y:7.1 Z:7.2 etc to mark each individual LUN for the disks.

But extendos just reports 'unknown device' for each of the other disks.

Has anybody else managed to get this working ?

It works on my PC under WINDOZE fine....so it's definately software at fault.

Can anyone help?

> >do the trick and still cool the computer enough. I think someone
> >had done this with a regular resistor.

The resistor might work but, keep in mind that the fan needs an
specific current to start spinning. As the fan gets older and dusty,
chances are that it won't start with such a limited amount of current
available. I definately won't do that.

To keep the case open is not good because moist and dust might
create conductive impedances between the pins of the chips specially those
clocked at high frecuencies; in other words fast worn-out.

Atari DID do ok placing the fan there; BTW the case is not only there
to hold the cute multicolored FALCON 030 logo ;).

Keep cool:

How about connecting the fun to a simple heat activated switch?
(don't remember the english word...maybe something like thermo...)
I mean a switch that turn's on the fun only after the temperature has
reached a predifined level.

Source record: 17991

Miika tervo wrote:

> As long as you disable the parity jumper then almost any SCSI controller should work with it <not guaranteed>.

A lot of Quantum drives, especially newer ones, don't have a jumper for this. With such a drive you need special software, e.g. HDDRIVER or SCSITOOL, to switch parity off. This operation is only possible on a machine that supports parity, e.g. TT or Falcon, because you can't switch parity off this way as long as your ST doesn't recognize the drive.
So you have to connect this drive to a TT or Falcon, use SCSITOOL or HDDRUTIL on it to switch parity off, and afterwards it will work fine with an ST. (This setting is permanent.)

>computers on the network.

I suppose I have some further information about the Universal Network somewhere, but I'd like to know does it also work with Medusa and Hades? Let's say that I am doing a Calamus document on Hades and I would like to print it out with a Linotronic, which is connected to another TT (at ACSI), would it work and if it worked, is the printing actually processed with Hades or TT?

Is the Universal Network only for Atari platforms, or can it be hooked to any other networks, such as Ethernet?

Of course they would. We're talking about Atari, remember? ;-)

: >2) Fan regulator. I read some german docs about installing regulation
: >circuits for the fan.
:
: If so, it must have a fast response to heat.

Shouldn't be a problem. Most regulators ("Noise Killer" is probably the
most famous.) works very well. The most important thing is where to put
the sensor.

: >3) A new, quieter fan. I just don't think that this would help things
: >much... Of course, I'd be glad to know of a replacement fan if it
: >really is noticeably quieter...
:
: Actually is a good idea. The problem is to find a low decibel
: noise fan and they're scarce/expensive.

You could also slow down the fan a bit with a resistor.

Or...

4) Disable the old fan, and get a new, quieter fan wich you mount
vertically next to the ROM-port.

: We feel the noise because we have the whole computer right in
: front of our faces. (and we're used to the quiet ST). If you're thinking
: in upgrading , I would consider getting another case and an stand alone
: keyboard. (option 4;)

All PC's make a lot more noise than even the most noisy Falcon. Back in
"the good old days" (Before the inkjet) you could buy some big, heavy
cases with a glass-lid to place the printer in. Get one of those for your
Falcon :-)

Well...Atari has never been known to spend extra money on something
that didn't have to be there...more like they cut every corner possible,
and the Falcon should really get two or three fans in more logical places.
Atari has always been known for cutting cost any way possible...just
take a look at the Atari chasis for many of their machines...the main
reason they could sell-um so cheap! Notice how they put the midi thru pin
in the midi out port rather than adding a third port. Notice how the
Falcon got a serial port chopped out of which the logic is actually on
board. Notice how it got cheap mini audio plugs over nice pro balanced
connections. All of this to reduce manufacture cost...consumer price...
etc...

In defense of Atari...they've always had some of the best
engineers/designers in the world...always had good products...just
couldn't sell or service their way out of a paper bag!

Brian

Hmm.. I still think it could be the jumper on the expansion port. Sure
that he hasn't done anything with it? If it should be the NVRAM the
logo should come up as it's the first thing that happens when you
turn it on. To reset NVRAM it must scan the diskdrive and it sounds
like it doesn't do that either, or? I guess it could be many different
things. What about removing and reseating the memory card?

Well, maybe someone else knows better as I'm no expert at this. :-)

630. FS: Atari Computer Goods! Even More Atari Stock! FREE Catalogs!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-21 00:00:00 UTC
From: bensmith@kelly.teleport.com
Message-ID: <5ek0nh$s41$1@kelly.teleport.com>
Source record: 17861
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,abg.atari

Check out my Updated Atari Catalogs and find More Atari stuff! I've got Monitors for your Atari 8 Bit like Commodore CM-141 "Like the Commodore 1802" And Disk Drives for the Atari 8 Bit like Stock 1050 and a 1050 Duplicator Drive for Backing Up Software. Plus I've bought out the Game Cartridge Gorf for the 400 & 800 & the Educational Math Game Cartridge Space Journey for any Classic 8 Bit Atari Plus I've cornered the Market on New Copies of Print Shop and some Print Shop related Items! That's Gorf, Space Journey & Print Shop All New Copies, All for the Atari 8 Bit! Plus a Good number of SSI and Avalon Hill/MicroComputer Games, and Many of them are Complete. Plus some Flight Simulator II from SubLOGIC including Scenery Disks all for the Classic Atari 8 Bit. For the Atari ST & newer Computers I've added to my HardWare Catalog Spectre GCR Mac Emulators, Indus (Future) GTS-100X Disk Drives, Panasonic MultiSync Monitor that does Double Duty for both ST Color and MonoChrome Monitors and the Cable/Hardware to your ST Computer. I've also added Software to my ST Catalogs & revised my prices. Titles such as Shrink Wrapped Brand New copies of Ultima V for those of you Ultima Collectors & for you who like Flight Simulators, theirs F-15 Strike Eagle, F-16 Combat Pilot, Falcon, Falcon extra Missions Disk, Fighter Bomber and Flight Simulator II. In Productivity Software, theirs Data Manager ST, Degas Elite, Easy Draw, MultiDesk, NeoDesk, Revolver & PageSTream. All for the ST.

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports.

You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

--

Atari ST and Classic 8 Bit, Hardware, Software, & Accessories. (503)256-9974. DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or by WebPage at www.teleport.com/~bensmith/bscomputers.shtml Catalogs Requested by & Received Through E-Mail at bensmith@teleport.com Please Specify Classic 8 Bit or ST!!

My guess is that they had lots of surplus fans which they had to get
rid of somehow... :-)

BTW, My Falcon still works fine without the fan... I can now also put
the HD to sleep when I don't need it. Now my Falcon is totally
silent... (And the HD doesn't generate heat, either.)

I'd still like to hear from somebody who has ruined his/hers Falcon by
disconnecting the fan... (And I mean an unexpanded Falcon.)

Greetings, Jouni

633. How to use Xwindow config files with BlowUp

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-21 00:00:00 UTC
From: p9548@iupmime.univ-lemans.fr
Message-ID: <199702211546.PAA11022@averell.univ-lemans.fr>
Source record: 17864

```
How to adapt X-window resolutions to Blow-Up Hard II.

This can be done easily only with the BlowUp Hard II
video enhancer (and ScreenBlaster), because only those
can set the pixel clock. Other video enhancer can't
set the clock frequency (they got fixed clocks so only
some video modes are avalaibles).
The X-Window video modes can be found into the file
/usr/lib/X11/doc/Monitors.txt witch contains video
modes for the XF86Config file (the configuration
file of X-Window).

In this file you can find for each monitor some values
for the video registers.
For example the text for a NEC Multisync 3D is:
"640x480" 25 640 672 768 800 480 490 492 525
"800x600" 45 800 840 1224 1264 600 600 606 624
"800x600" 36 800 824 896 1024 600 601 603 625
"1024x768" 46 1024 1064 1224 1264 768 777 785 817 i

* The 1st column is the name of the video mode.
* The 2nd is the Dot Clock. This is the pixel clock for the
video processor. It is the same CLOCK with the BlowUp.
* The 3th column is the hdisp (Horizontal Display). This is
the horizontal resolution of the screen. In BlowUp it is
the XRES value.
* The 4th column is the hsyncstart (Horizontal Synchro
Start). This is the distance (in pixels) between
the horizontal synchro and the beginning of the screen.
It is in BlowUp the LEFT BLANK.
LEFT BLANK = hsyncstart-hdisp.
* The 5th column is the hsyncend (Horizontal Synchro
End). This is the distance (in pixels) between
the horizontal synchro and the beginning of the screen.
It is in BlowUp RIGHT BLANK.
RIGHT BLANK = hsyncend-hdisp.
* The 6th column is the htotal (Horizontal Total).
This is the width of a line in total: synchros +
screen. In BlowUp this value is displayed in W:
parameter. RIGHT BLANK should be adjusted to have the
same value in htotal and in W:.
* The 7th column is the vdisp (Vertical Display).This is
the vertical resolution of the screen. In BlowUp it is
the YRES value.
* The 8th column is the vsyncstart (Vertical Synchro
```

Start). This is the distance (in pixels) between
the vertical synchro and the beginning of the screen.
It is in BlowUp the UPPER BLANK.
UPPER BLANK = vsyncstart-vdisp.
* The 9th column is the vsyncend (Vertical Synchro
End). This is the distance (in pixels) between
the vertical synchro and the beginning of the screen.
It is in BlowUp BOTTOM BLANK.
BOTTOM BLANK = vsyncend-vdisp.
* The 10th column is the vtotal (Vertical Total).
This is the number of lines used in total in one screen:
synchros + screen. In BlowUp this value is displayed in H:
parameter. BOTTOM BLANK should be adjusted to have the
same value in vtotal and in H:.

Note: Vertical synchro seem to don't work with the values
so try differents ones if it doesn't work.

638. FS: Some atari software, hardware goodies to clear!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-21 00:00:00 UTC
From: "Dr. Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <E5yr01.2tL@cf.ac.uk>
Source record: 17869
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

There are still several software and hardware products, suitable for
atari ST, TT, Mega's and so on which I'm sure will be useful to someone
out there. I've listed approximate prices for each, if you are interested
in anything then contact me via email on spesgw@cf.ac.uk....

Software:
Script wordprocessor (original version) : 20 UKP
Breakthru 2 plus (32 midi channel version) : 50 UKP
Twilight screen saver : 15 UKP
Calligrapher gold version with extra paks : 25 UKP
Easy Draw 2 : 15 UKP
MagiC 4 : 30 UKP
Ease 4 : 25 UKP
Kobold 2 : 25 UKP
SC55 editor from Kang Kong productions (excellent gem package) : 30 UKP
Neodesk 3 : 10 UKP
Personal office comms : 10 UKP
System solutions pro truetype font pack (5 disks) : 20 UKP

CD roms
Suzy software treasury (2 CD's) : 25 UKP
Gemini shareware CD vol 1 : 20 UKP
German shareware/pd/TTF and calamus fonts/clipart : 25 UKP for 2 CD's
Assorted clipart c.d's : 15 UKP each

Hardware:
External SCSI CD-300 apple cd-rom drive (suits falcon or TT or ST/e with
host adaptor), complete with latest extendos pro : 100 UKP

Vidi 12 ST colour digitiser package : 30 UKP

Graffiti PAL genlock for atari STe (with PSU) : 85 UKP

Hama trilock digital pro genlock (suits any computer) : 225 UKP (as new)

Misc software (for PC)
Visual reality 3D package (all boxed with manuals) : 50 UKP

Regards,
Simon

There is a tech manual on the net somewhere which gives good descriptions of the ST sub block functions, but no circuit diagrams are included.

If you buy a copy of the ST service manual, you get circuit diagrams of the ST & some information on how the custom chips work.

If you want to seriously hack your ST, or are just curious, it's well worth the money.

I got mine from :-

Assuming what you're asking is how to get it into a form that the ST can read...

Format the disk to 720k on the PC (usually the PC OS is "too dumb" to read floppies formatted on the ST with versions of TOS before 1.04).

Unzip the files onto the floppy, or locate STZIP and (if your ST ahs a ahrd drive) unzip the files on the ST. Since the x86 processors excel at number-crunching, I'd opt for unzipping on the PC in a floppy-only-ST situation.

Put the disk into the ST's drive. Do whatever you would normally do at that point.

Keep in mind that no matter what you do to the disk, you still can't run programs written for MS-DOS/Windows/OS/2 etc. on the ST without some sort of x86 emulator.

Posted and mailed.

> b) has anyone experience with the noise of the HD Atari MegaFile 20. (It
> makes me very tired|-).

On most MF20's there are two reasons they are so loud. One is the fan, it is quite* loud. Replace it, or unplug it and leave the top off your MF. The other reason is the drive mechanism. It is also very loud. It makes a high-pitched whine that none of the four other ST-225 drive mechanisms that I have make.

Overall the MegaFile20 is pretty loud. :) Personally, I just replaced the loud 20mb drive with a much quieter 30mb full height drive, and put it all into an old PC clone case. Much quiter now...

>If it helps, I have the numbers on the TOS chips, which are four(4) in
>number. (although there is a fifth chip, I am not sure if it is a TOS
>chip)

From the info in your original post you have a rather interesting variation of a TOS 2.06 upgrade. The STE and Mega STE generally have a pair of 32 pin IC sockets for their TOS ROM's in which a pair of 27C1001 or 27C010 EPROM's are placed. These IC's will hold 128kb of data each. The IC's in your upgrade are 27C512 EP/ROM's which hold 64kb of data each. As TOS 2.06 is placed on a set of ROM's totally 256kb of data it is obvious that two 128kb or four 64kb ROM's (as in your case) are required.

From this information you should be able to see that because a Mega STE has only two IC sockets and your TOS upgrade came on four IC's it will be physically impossible to use your TOS ROM's directly, but should you have an EPROM programmer capable of programming the 27C1001/27C010 EPROM's you could actually burn your TOS 2.06 into a pair of these EPROM's. Now of course there are several concerns that must be addressed here. (A) Are you legally entitled to copy the ROM's onto the more appropriate IC type. Since you are the owner of ONE set of ROM's you may actually be allowed to copy them onto the right type of IC for the Mega STE provided you erase your old set with a UV lamp once you have a working pair of ROM's. I imagine this is permissible since you are a legitimate owner of the TOS 2.06 ROM set. To get the ROM's working you will need to copy to of the ROM's into on ROM and two into the other. Where they are to be copied in one after the other or have odd/even insertation I could not tell you. It is possibly a trial and error exercise. (B) Depending on your country you may not even be entitled to do the above and copy the ROM's at all!

>Some of these chips seem to have a clear window in the top,
>with another smaller chip visible inside the window.
>Are these even legit chips???

The window is to allow the EPROM (Erasable ROM) to be blanked by a UV lamp. There is only one chip in the IC package and that is the shiney piece of silicon that you can see sitting inside the window.

Are they legit chips? Well, by the sound of it they are part of a TOS 2.06 upgrade board so they probably are. If the printed circuit board I assume they were mounted on is of commercial quality I would assume it is some type

of legit TOS 2.06 upgrade board, but from whom I couldn't say. A 4 chip TOS 2.06 upgrade is unusual from what I have seen of them and the 5th IC is probably a PAL, GAL or some other logic circuit to control switching between the 4 EPROM's for access to data from the ROM.

>Thanks for any help/info

No Problem.

Liebe ATARI-Fans,

vor ein paar Jahren habe ich bei CATCH-Computer/Aachen eine 2MB
RAM-Erweiterung (MEG-2ST Ramcard) gekauft.
Den Laden gibts nun leider nicht mehr. Schade, die waren echt
nett...

Meine Frage ist nun:
Kann man die Erweiterung wohl auf 4MB aufruesten? Die Tatsache,
das zwischen den 4 Chips die da schon drauf sind jeweils Platz
fuer einen weiteren Chip ist, verleitet zu der Vermutung.

Ueber Hilfe und ne kurze mail an holger_birkmeyer@compuserve.com
waere ich wirklich dankbar!

Bye
Holger

Hello,

Just one silly idea :
I don't use my Falcon anymore, as I now use a -PC- (I know ;-)...). But it still has a 80MB HD, 4MB RAM a DSP & Midi I/O. That's all it takes to have a Multitimbral synth doesn't it ? So is there a software out there to do that emulation ?

Thanks,
Steph

The jumper should be on the expansion port, which consists of 2 sets
of connectors, under the keyboard, on left hand side of motherboard.
The jumper, is on 2nd row from front, the location is marked by a
white line on the motherboard.

The NVRAM can be reset by software. I wouldn't touch it when you open
the case. It contains a lithium cell, this will fail at some time,
but I havn't heard of that happening on a Falcon yet.

Try reseating any IC's which are in sockets, and blow away any dust or
other debris.

Yea, it would, but I was thinking ahead to distribution... Most people
wouldn't be too happy about a disassembled version being re-distributed
without their permission/knowledge (or having abandoned the scene), but
they couldn't complain about a little text file that told you to change
the byte at ofset xxx to 00 from 01 if you want an external clock...

(of course, to find the correct byte you would use a disassembler. :)

Okey. That might be a better solution. Does the sound level drop much
if you use this solution?

> would I find the NVRAM and this jumper that's been mentioned?

Well if he hasn't done anything inside dthe computer it wont be this,
but the jumper should be on the upper of the two expansion bus connectors
(sitting to the left below the PSU. It's marked on the PCB where it should
be.

If you remove this one the computer will not boot.

I have no idea where the NVRAM is, but you can reset by a using a boot
floppy with the correct program (or however it work), but to be able to
do that the computer must atleast be able to boot from a floppy.

Either download my EJP FAQ (now looking old and dated, but university
work and writing for Atari Computing naturally take precedence). It's
on my web pages, in not quite completed ST-Guide format.

=OR=

Subscribe to Atari Computing where I'm doing a series of articles on the
uses of the enhanced joystick ports. Issue three contains an introduction,
issue four will have the hardware details of the joypad. Issue five will
start to cover joypad programming, and then I start to zoom off into the
realms of team taps, light pens and more mice than are good for you.

Cheers

Xav

664. Reading Sectors on Damaged Hard Disk

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-24 00:00:00 UTC
From: Frederic Faucheux <Frederic.Faucheux@int-evry.fr>
Message-ID: <3311C0D2.41C6@int-evry.fr>
Source record: 17895

My jaz drive unfortunately fell from the table some time ago.
It appears that only the cartridge/disk is damaged. Then I would
like to transfer all the (readable) data to a new cartridge, sector
by sector. I use a temporary file on my hard drive to store the data.

Here is my configuration:
- Falcon 030 / 4Mb
- IDE Hard Drive 120Mb
- SCSI Jaz Drive

I wrote small programs using BIOS 4 and XBIOS $2A (DmaRead)
functions. The problem with Bios4, is that an alert box appear each
time a damaged sector is read, and with DmaRead, when a first error
occurs (damaged sector...), I cannot after access any other sectors
unless I unplug the SCSI device. In the two cases, I cannot do the
transfer very quickly.

Can somebody tell me if there is a simple answer to this
problem, or if I will have to consider using directly the $ff86xx
addressses ?

665. PAnTHer problems

Newsgroup: comp.sys.atari.st.tech
Date: 1997-02-24 00:00:00 UTC
From: "post2news.demon.co.uk" <paul@ssurreal.demon.co.uk>
Message-ID: <01bc227b$66ed97e0$LocalHost@ssurreal>
Source record: 17896

I'm using the program PAnTHer to redirect files on an Atari STe (4MB).
Everything seems to work fine, but when I try to back up redirected files
PAnTHer intercepts and attempts to copy the file back into the directory
its coming from!

The documentation mentions a #!LOAD option (hash, exclamation mark LOAD).
I've tried this, but PAnTHer just ignores the command, as if it isn't
there. I've tried the #!LOUD command, and it seems that PAnTHer is ignoring
this too. Is there:
a) A bug (unlikely)
b)Something I'm doing wrong/misunderstanding
c)A good reason for it not working

Please email me - I'm not a regular user of newsgroups!

Thanks in anticipation...

I just took it apart and took a close look inside. Everything looks real good so far. Got it from the fellow earlier today.

: If you remove this one the computer will not boot.

The interesting thing is that I gave it another test, turning it on without anything connected. The little power light barely comes on, and the floppy light doesn't come on and neither does the floppy run, after holding it and watching it for a couple minutes. So, I'd say that the power supply has failed. If that's so, then I need the power readings for each pin.

Once I get that, I could easily hook up an external supply to it.

For the keyboard, there's what looks like two extra unused pins. The other ST systems used all the pins.

: I have no idea where the NVRAM is, but you can reset by a using a boot
: floppy with the correct program (or however it work), but to be able to

I didn't take it all the way apart, just enough to get a peek underneath. I did see the internal IDE connectors, but didn't see the SCSI. I'd definitely need the connectors to allow me to use a monitor and an external SCSI device, namely my ICD AdSCSI+ adaptor.

: of connectors, under the keyboard, on left hand side of motherboard.
: The jumper, is on 2nd row from front, the location is marked by a
: white line on the motherboard.

I found that one. It's marked as to which ones to jumper. I'm going to be looking around for the Falcon tech specs, to help out when I'm putting future upgrades in it.

: The NVRAM can be reset by software. I wouldn't touch it when you open
: the case. It contains a lithium cell, this will fail at some time,
: but I havn't heard of that happening on a Falcon yet.

That I can understand. What I need to know is how to know when this cell is going bad. I've seen it happen on one of my two ICD AdSCSI+ adaptor, giving weird dates upon bootup. They're cheap, around $3-4 USD. The other one has yet to be changed, going for 6 years straight, with the occasional power down for a few minutes to clear the memory and so on.

: Try reseating any IC's which are in sockets, and blow away any dust or
: other debris.

The entire thing, both inside and out, is quite clean. I can't say the same for some other ST systems I've seen on occasion, with thick coverings of dust. I remember taking apart an HP server, and finding an amount of dust that would choke anyone who was allergic to it. Fortunately, I'm not.

However, if you read my next message, you'll find that I believe it's a bad power supply. I have a user group meeting soon, so I'll see if my diagnostic is correct.

Hmmmm.... the EJP FAQ doesn't actually have detials of using a joystick as a joypad. It _does_ cover using a joypad as a joystick, which is obviously a different thing altogether. It also has details of using two joystick in one joypad port, but this only works with Dynabusters.

The best way to use a joystick as a joypad is to gut a normal joypad, and connect flying leads from the switches on the joystick in parallel with the switches on the joypad. Personally I would be inclined to build the support hardware from scratch (it's not that hard) based on the schematic in the FAQ.

The schematic is due for an update, to a nice proper image rather than the ASCII art it is at the moment. The best version of it is coming in issue 4 of Atari Computing, where the whole innards of a joypad are dissected and explained.

Cheers,

Xav

Well, you didn't see the SCSI connector as there is none, if it's not
a Falcon MK-X which has an internal SCSI connector.

The standard falcon has only an external SCSI connector.

Hi Martin,

I would suggest you join our DirecT40/T60 Support e-mail list. Many users of Hades are subscribing to this list and are posting as well as replying to posts. Very informative.

To join, send e-mail to support@compdirect.com and use
Join Lists DirecT40/T60 as your Subject.

You can also get a complete list of our service at

http://compdirect.com/directions

All the best,
Chris @ Computer Direct

When a file is deleted, normally all that happens is its name is
marked as deleted by a special character and some markers saying which
parts of the disk it was using are set to mean those parts can again be
used.

The actual data is not destroyed *but* it's obvious from the above
that any attempt to write more data to the disk can easily reuse the
some of the same parts and thus destroying the old wanted data. So, if
you've been using the disk since things are looking very grim indeed.

On the assumption that (a) Notator uses normal files and (b) you have
not used the disk since, then you stand a good chance of recovering
the whole thing using a special "undelete" program. I'm sure someone
here can recommend a good one and where to find it.

>problem, or if I will have to consider using directly the $ff86xx
>addressses ?

The docs I have for an ST mentions etv_critic (long at $404) can be
used for BIOS errors.

quote ...

Critical Error Handler (logical vector $101). This vector is called by
the BIOS when certain errors (such as Rwabs() disk errors or media
changes) occur. This allows an application to take care of its own
error handling. When execution passes to the handler at this address,
the first word on the stack 4(sp), is an error number, and other
parameters may follow it, depending on the error. The handler should
preserve registers D3-D7/A3-A6, and when it returns, it should place a
longword error code in D0.

Error Code Action
---------- ------
0x00010000 Retry.
0x00000000 Ignore the error.
0xFFFFFFxx Abort with error.

The default handler merely returns a -1L.

.. end quote.

So I guess you could make an image simply by installing a clr.l d0 and rts there. I assume its rts - docs dont say.

If you can figure out (or someone else knows) if there is a "bad sector" argument passed then you could also generate a defective sector list as you go.

Hope it works!

:
: Well, you didn't see the SCSI connector as there is none, if it's not
: a Falcon MK-X which has an internal SCSI connector.

I came back from a user group meeting, and had one of our resident 'electronic specialists' take a look at it. This time I noticed more. It does have both the SCSI and IDE connectors. When he turned it on, the keyboard light came on fine. Seems I didn't see something on the underside of the case that prevented part of the light from coming on. We both agreed that the power supply was fine, after doing testing on the lines while it was on. The 12v lines seems a little low, around 11.5v or 11.2v, I believe, while the 5v lines are fine, though that shouldn't cause this problem. The floppy light doesn't come on, neither does the floppy run at all. The screen goes to white, and that's it.

Even our resident 'specialist' is a little stumped. He can usually repair a monitor at the meeting or somewhere else, but this one he said he hasn't heard of this problem. I'm open to ideas before I bring in the help of Toad for repairs.

: The standard falcon has only an external SCSI connector.

I know. The other Falcon owner in our group says mine has a LAN port, while his doesn't.

I've crossposted this to comp.sys.atari.st, for a more wider group, so if anyone doesn't wish to see it in both, can let us know to keep it in the comp.sys.atari.st.tech group. To those just now reading this, I came across this Falcon that has a problem or two, and you know the rest of the story. (jeez... am I becoming like Paul Harvey?)

The old number I had for them is (44) 202 659991.
Cost me about £30.

May not be the latest version, you should ask what they have.

Mine was called the ST 1040 Service Manual, but seems to cover all of the STFM types.

Source record: 17919

Hi folks,

I've been using one of those huge slab type Gasteiner Mega Drives for the past few years and its 100Mb Quantum unit just isn't big enough any more!

Anyway, I can add a second drive unit into it but that's all I know about it. The manual is useless - "go make a cup of tea" is about the best advice it gives. ;-)

The unit has one green access led on the front right edge. On the back, a power switch, mains socket, and two D type ports labelled "DMA", one "IN" the other "OUT". There's a set of dip switches for the unit ID (I assume) which is to the left of "OUT".

2 basic questions:

a) Just what is DMA out? - like has it been 'scuzzified'?

b) So i rip it to bits to add another bare drive - what can go in there? I assume this is going to be easiest as I just plonk in a suitable scsi jobby? Will the PSU in there hack it?

Answers etched onto either or both sides of a wooden lollipop-stick to the above addwess please! ^^^^^^
||
"Gregory Peckory!"

[this is a serious request btw].

If you get a white screen, things are at least partly working or the video
circuitry would never get properly setup.

(One way to get a white screen is to remove your afterburner card, try to
get everything else back in order, but be unable to solder two surface
mounted '030 pins back. I have personal experience with this...)

The white screen means that the processor is running, the lack of a logo
means that the blitter hasn't put it there for some reason.
In my case that was most likely caused by the bus arbitration lines being
disconnected causing the blitter to never receive the bus, while the '030
kept waiting for it to finish...

So, one guess is that the blitter might be dead. I'd hope not, though,
since that would require the replacing of a surface mounted chip.
I'll take a quick look at the startup code to see if there's anything
else obvious that's happening there.

>I know. The other Falcon owner in our group says mine has a LAN port,

Are there Falcon's without LAN port?
(Not that it's very useful.)

I've got one of those too. An obvious answer is 'Go back and see
Gasteiner'.

However, there is space for two hard drives inside the casing. When they
put mine in, this was quite easy to see.

The DMA sockets on the back I believe are SCSI's, but if anyone knows
better then please correct me.

Do you have the Gasteiners hard drive owners manual. That should give
you all the info you need.

Salut,
I have just been given a 1040STe and I would like to know which jumpers I must enable/disable to put TOS 2.06 (32 pins Eprom chips) instead of TOS 1.4 (28 pins ROM chips); can anyone help me ?
Why TOS 2.06 ? because my other ST has TOS 2.06 and the disks are formatted for that TOS AND it has a much nicer desktop.

Thank you for your help.

Has anyone ever seen any DLLs for the Atari?

Or know of any programs that use them?

I have been working on a TSR that allows the loading of modules and "DLL"
like extensions or plug-ins. It will be released later this year, and will
be freely distributable (within reason).

(More details will be forthcoming - I am still debugging the Load/Free
funcs, as well as make it somewhat more "intelligent")

Shared libraries are really only useful in a multitasking environment,
otherwise only a single process would ever use them at a time anyway.
Of course there are benefits of being able to fix bugs without re-linking
the executable.

You may want to look at MiNT--it may have support for shared libs.

Also, shared libs, if not implemented correctly, may cause problems in
a multitasking environment with memory protection between processes.
Generally, shared lib code will reside in "shared, read-only executable"
memory space.

Here's this months update to the FTP site list.
As you'll probably notice, this list is a lot smaller than the previous ones. I'm happy to say that it's *not* because sites having closed down or anything, but because I've chosen to omit the "How to use FTP" part from this update and onwards.

Most of you already know how to get hold of files via FTP, either by using FTP/ncFTP etc. or WWW. For those of you who don't know (or would like to learn more about it) you can still get hold of this documentation as a separate file. It's available from my Atari section web pages, or directly at:

ftp://ftp.sn.no/user/hallvart/atari/info/ftp_info.txt (16 Kbytes)

(which incidently is in the same directory as the FTP site list)

There's one change to the list this time- a new site, from Karl Samyn of Belgium: ftp://193.190.205.13/archive/atari/

Hallvard

MIRROR SITES

FTP mirrors are alternative sites to certain popular ones which are
usually under a high load most of the time (many people accessing them
at the same time).
Mirror sites contain the exact same directories and files, but have
different entry points. Try to use the one closest to you geographically
and not during business hours (in that geographic area).

MAIL SERVERS

Mail servers can be used to get hold of the same software as through FTP,
but instead of using a lot of download time online, files can be 'ordered'
via email.
In order to get information about how to do this, send an email to the
various addresses below with the word: help
in the mail itself. If possible, do not include any 'signature' in the mail,
as the automated system which replies to these mails tries to interpret any

message (and with a certain amount of errors no response to your requests
will be given at all).

Ok, I need a GEM desktop Disk(s) For my IBM(I am Sorry) But I also have a ST. Now, I have the startup Disk, along with a GEM Paint, and GEM write. I need is the Atari PC GEM Desktop. I would REALLY like to get it running, because I am a IBM windows Hater, and I would like to see if I can Make this IBM look like and act like My ST. Especially if it is less buggy, which it most likely is. If anyone out there in Atari Land can help Please E-mail Me back...

j> the is a major no-no for the Atari. I bought a Fireball TM back in
j> December and tried everything possible to get it to work with no
j> success what-so-ever.

Last week I've tested a Quantum Fireball TM for a friend of mine and it worked, but only on a Falcon030. I had to turn on bus arbitration on the Falcon and unit attention on the hard disk itself (trough a hardware setup utility). Altough it worked (and was quite fast), it was impossible to boot from that drive because it requires an initiator identification, which TOS doesn't supply.

On an ST it's impossible to use such an hard disk, unless you have a LINK96 host adapter. All the other SCSI interfaces don't support bus arbitration.
Ciao,

>
>The standard falcon has only an external SCSI connector.

What's worse is that Robert wasn't really looking for a SCSI connector - he was looking for a DMA (ACSI) port, and the Falcon doesn't have one. Notice that he wanted to hook up his ICD AdSCSI+ - the Falcon has no place to connect one, and doesn't really need one since it has the SCI-2 port right on the back panel.

Sounds like either a very dirty head (perhaps one of your disks lost a flake
of media and it stuck to the head), or your drive has died. There are chips
on the drive's board, too - if one of them goes t*ts-ups, the drive may appear
to be physically OK, but it won't be able to transfer data in either direction
(or only in one direction, if a specific part of certain chips blow).

Simplest fix: get a new drive.

Try to be the best of whatever you are, even if what you are is no good.

I am still not able to receive faxes with ANY software (BTfax-coma-starcall) on my BBS running Semper.

I tryed calling Coma with "-fcon -rv" configuring the modem, but the file received is not correct. Can anybody help me ?

Faxes are received correctly if I leave Coma answer directly at calls.

It was working ok with BTfax and a ZyXEL, now I have a USR Sportster voice 33600.

>otherwise only a single process would ever use them at a time anyway.

Yes, but I don't think you should look at the above as shared libraries
in the normal sense. DLL, after all, stands for Demand Loaded Library.
That is, a library that is only loaded when it's needed. It doesn't
necessarily have to be sharable by definition.

IMO this would be a generalized way of dealing with for example load/save
modules in image or word processing programs.
If it's released soon enough, I'll definitely consider using it for the
module system that will go into the next version of MGIF. Otherwise I'd
have to write something similar myself.

>Of course there are benefits of being able to fix bugs without re-linking
>the executable.

Perhaps, but for that to be really useful your executable would, IMHO, need
to be partitioned into relatively small 'library chunks'.
It's after all not that often that serious bugs are found in the standard
libraries themselves.

Er, so the help file is compressed then? If so, there's not a lot of point in me looking at it (unless its just zipped or something). I've searched high and low for the english docs btw, and come up with nothing. :-(

My System Solutions catalogue shows a program called "The digital sound
module" which does just this!
Itt utilises the DSP chip in the Falcon to create a 24 note polyphonice,
16 part multi-timbral General MIDI sound module.
As my catalogue is a pretty old one (1995) the program was just about to
become available, so no pricing was given, but I'm sure you'll get all the
details by contacting them directly:

sockets and the |
"long" ROM chips | ^
go up to here ->| |
(desktop HD format option)

---------------------------Front (keyboard end) ---------------------------
```

IMPORTANT!!!! As the ROM chips in TOS 1.xx and 2.xx are electrically different you need to move the resistors/jumpers differently according to which type of chip you're using. My STe had resistors in place of jumpers, but the circuit papers from Atari simply show jumpers being used, so I guess this might vary from machine to machine.
I've also been told that the resistors are actually zero ohm resistors! Strange.... Well, use whatever's in your machine.
I'm referring to the positions marked "w102" and "w104" on the STe's circuit board.

Also, when changing over to TOS 2.xx you can join together the "E6" pads and gain access to a "high density" format option on the desktop with no additional software needed! Just select "format disk" from the desktop and you will have the choice of formatting the disk as single sided/double density and high density.

But I'd recommend against using the desktop formatter- it's not really MSDOS compatible, and it's slooooow! I use a shareware program called "Hcopy" instead, but there are several other excellent copy programs which support HD/DD disks and do it in MSDOS.
Still, it's cool to have the HD format option on your desktop when you select "format disk" ;-)

After having installed TOS 2.06 the machine will behave a little differently from older versions of TOS. First of all you'll get an Atari logo on the upper left hand corner of the screen, then a memory test will start- a long bar getting shorter and shorter. This takes ages to finish. You can skip it by pressing any key.

When the disk drive starts rotating you might be in for a shock (I know I was and I thought something was wrong- because I had nobody to tell me what I'm now telling you!!). The disk drive might make a lot more noise than before. But don't panic! This is due to the support of high density (1.44MB) disk drives and the step rate which has been altered to allow them to be used.
There are small programs available for this, that alter it back to the usual DD standard, and quietens down the drive (although the drive still seems to make more noise than in the previous TOS version).

One such program is "hd_fdc.prg" which goes in the auto folder. It's free and should be available many places. But there are a few other programs like this as well.

SUBJ: Q: 110V ST with 220V monitor?

h> I am buying a MEGA ST4 from the US, but I am keeping my old monochrome
h> monitor... I guess this is no prob, but I have to make sure. Please,
h> anyone?

I modified a MEGA PSU last week to run on 240V.

You'l need to replace the Main smoothing capacitors with 350V jobbies, and
there's a link to remove also, This sits physically between resistors R1, R2,
R3. check the line voltages with the PSU disconnected from the host after
this mod.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

** Mega STE + PAK 030 @40Mhz, 68882 FPU, 4 Meg ST, 16 Meg TT RAM **

712. connecting falcon scc port to st rs-232 via null modem cable

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-01 00:00:00 UTC
From: davecook@wt.com.au
Message-ID: <5f8qr4gek1@kurica.wt.com.au>
Source record: 17938
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I'm wanting to connect my 1040sftm serial to the the LAN port on my Falcon (the modem port is already occupied by a modem).

Looking at the pinouts for the falcon lan socket, doesnt give me any clear idea on how to connect the two together.

Anyone know how I can do this?? Or if it is possible at all? I don't want to fry the serial chip on the falcon :)

Cheers,
Dave

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,abg.atari

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks, Labtec Speakers & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: 1040STF Computers, MonoChrome Monitors, Monitor Master Switch Boxes, Hard Drives, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials.

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

714. Disk drive not responding!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-01 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <331807804bf232@sn.no>
Source record: 17940

My disk drive seems to have died for some strange reason...

I was working with my computer and decided to try out a few disks
(I usually use my harddisk), but seemed to get read errors all the time
with a few disks. Strange I though to myself- they've worked before.
I kept trying more disks and after a while I couldn't read any disks at
all!

The only message I keep getting is "disk drive is not responding".
I was worried that my disk controller chip was blown (especially since I
had recently installed an AJAX, hoping to get my HD drive working in HD
mode soon), but replacing it with my old WD-1772-02-02 changed nothing, so
I suppose the fault is somewhere else.

I'm going to check the ribbon cable from the main-board to the disk drive,
but I doubt that's where the problem is (though I hope it's a simple thing
like that). Any ideas about what might have gone wrong and why?
By the way, the drive spins when accessed and everything *seems* fine,
but it won't read or format any disks. The printer, modem and harddisk
ports also work fine.

>My disk drive seems to have died for some strange reason...

You probably knew this, but while you're inside your machine, press all the socketed chips back into their sockets. On my STs, the square chips have a tendency to 'walk' out of their sockets over time and often times the first symptoms are drive problems.

Just a thought.

So I could actually replace them with a normal jumper then?
That would make things easier if I was to change over to some other ROM
chips later, as I wouldn't have to de-solder, move and re-solder the
zero-ohm resistors.

From the Holy Book of <E6Br2o.4Iv@novice.uwaterloo.ca>
as spake by atwareck@novice.uwaterloo.ca (Art Twarecki) :

>You may want to look at MiNT--it may have support for shared libs.

Unfortunately not. That's one of the things that gets suggested about
every six months or so on the MiNT mailing list; usually, it gets as far
as determining that it will require modification to the compiler to
generate the shared library and stub calls thereto before petering out.

: What's worse is that Robert wasn't really looking for a SCSI connector - he
: was looking for a DMA (ACSI) port, and the Falcon doesn't have one. Notice
: that he wanted to hook up his ICD AdSCSI+ - the Falcon has no place to conne
: one, and doesn't really need one since it has the SCI-2 port right on the ba
: panel.

You're pretty much correct. The Falcon is now apart, with nothing connected to it. It has the onboard SCSI and IDE connectors, which makes it a Falcon MK-X, according to Magnus. There's a possibility I may need a new board. However, once I get it up, I will connect the SCSI drives to it. I keep forgetting... What was the software that is normally used with the Falcon and SCSI drives? Was it HDriver?

To repeat what the problem is:

I turn it on, there's a white screen. I'm having trouble getting that screen with an old Amdex Video-300A, as well as a connection to my TV via switchbox. That's all I get. The floppy drive should do a search, though it doesn't. I connected a 720K drive to it, with the same results. The power supply feels fine, with the normal usual voltages coming out of it and the floppy power connector. I don't know of any local Falcon people who would be willing to help out with doing chip swapouts, to see what the real problem is. I'm in northern Kentucky.

I'm considering taking out the chips and putting them back in, but I don't think that'll do much. There's something called the Timekeeper RAM, which seems to be the NVRAM everyone's talking about. I need the specs on this, so I can measure the voltages, both in the socket and out.

Note that the LINK96 doesn't support bus arbitration but only initiator
identification. (See the SCSI-2 specification for details.) Bus
arbitration isn't possible at all with the ST because it requires a
fully functional SCSI bus which the ST doesn't have. But initiator
identification is all the Quantum drives need and so the LINK96 is
exactly the right host adapter for these drives.

>(or only in one direction, if a specific part of certain chips blow).

You may be right, because the drive seems to be accessed the usual way as before, but I'm not able to read any data off disks any longer.
I usually get the message "drive not responding", or some other error message like "disk unreadable" etc.
I've cleaned the drive's head, but it didn't help.

>Simplest fix: get a new drive.

Perhaps I should do that. I've been messing around long enough with this Sony HD drive, trying to get it to work properly to recognize HD disks, but with no luck. I got the Sony mainly because I was able to adapt the Atari front-panel and eject button to it (I'm not too keen on expanding the eject button hole in the case, making my computer look like something home-made.

I guess I'll opt for the usual Teac 235 drive, as I've heard of many people having used this sucessfully in HD mode as well as DD. I only hope I'm able to adapt the old Atari front panel and eject button in some way- any comments about this?

By the way, what about ICs on the Atari STe motherboard- are there any chips that might have "blow up" which only affects the disk drive?
I've already checked the WD-1772 (I also have an AJAX) and it seems OK.
The other peripherals are okay as well- harddisk, modem, printer, so any shared ICs for the disk drive and those are apparently OK.

: >be freely distributable (within reason).

a TSR approach to this under MiNT is a _bad_ move. Causes all sorts of
problems. Also, you can't load and unload modules on the fly. Fine if you
intending this to be used for SingleTOS without MiNT (TOS in ROM, basically),
but if you want this to work with MiNT then you'll need a big redesign.

: Shared libraries are really only useful in a multitasking environment,
: otherwise only a single process would ever use them at a time anyway.
: Of course there are benefits of being able to fix bugs without re-linking
: the executable.

: You may want to look at MiNT--it may have support for shared libs.

It doesn't as far as I know.

: Also, shared libs, if not implemented correctly, may cause problems in
: a multitasking environment with memory protection between processes.

Exactly.

: Generally, shared lib code will reside in "shared, read-only executable"
: memory space.

I would argue that a shared library/module/whatever who _always_ be in shared,
read-only memory. Anything that the module wants to be able to change should
always belong to the client application.

Incidentally, I am working on a Component Manager for MiNT (and only MiNT --
it won't work without multitasking support). I have no idea when it will be
finished, but I'm hoping that I will have a little time in about 13 weeks
(when I finish my degree -- wayhay!! :). It's all designed, and partially
coded -- I just need time to sit and code the rest.

Cheers,

James Cox.

>"The Poor Deluded Soul" - tderrick@acpu.com

I found your old post of AR20SET.ARC and AR20BOOT.ARC on Umich, but
I never found any other archive describing the modification itself,
or newer versions such as AR35 or AR36...

Where can I find a complete AR20, AR35 and AR36 archive, preferably
on a public FTP site? I found your AR20 posts through Shareware.com
but the whole archive wasn't there, only the 2 ARC mentioned above.

Any clues?

I want to build a monitor/keyboard/mouse switch to use on both my At

I've an idea of how to handle the monitor, plus I have an AT-Key
interface which I can use to wire the PC keyboard to the Atari but the
problem is the mouse.

I recall seeing some information on connecting a PS/2 type mouse to the Atari
by rewiring it but have been unable to locate such so would anyone have the
relevant info?

With this info I can then make a go at building a multiple system switch for
both my PC and TT.

g> the past few years and its 100Mb Quantum unit just isn't big enough
g> any more!

oooh!!, you said that MEGA word with the drive word. 8~))

g> 2 basic questions:
g>
g> a) Just what is DMA out? - like has it been 'scuzzified'?

Tisnt, its an ACSI through port, designed for chaining ACSi devices, such as
Laser printers.

g> b) So i rip it to bits to add another bare drive - what can go in
g> there?

Anything you like.

g> I assume this is going to be easiest as I just plonk in
g> a suitable scsi jobby?

Thats it, make sure the unit ID is higher than the one in there.

g> Will the PSU in there hack it?

Should do, mine did.

Regards from STEve & his nice warm cosey PAK'd MegaSTE.

No, non, no ! I dont think DMA port are SCSI's ! They are DMA ports, for an ST and not for a falcon ! SCSI card as "topLINK" for instance make available SCSI disks on ST, and also DMA disks on Falcon, but DMA disks

(made by atari) are limited at 40 Mb and more satisfaction is to use SCSI disks with topLINK.

I believe many persons have tested to use LAN port. But this usage is not
documented even it is similar at keyboard port...I think it is easier to
connect the two cartridges port. They are easy to program for
communication. Parallel port (printer port) is bidirectionnal on Falcon
but not on 1040 STFM. Finally, ITOS LAN network (cable with program) is
certainly also a good solution but it is difficult to obtain.
Good Luck !

Go to this page:

The Atari ST Emulator Page
http://ireland.iol.ie/~ajankows/st/pacifist.html

There you will find a link to a program named tosdump.
Both emulators I've downloaded don't work, so I can't say It works for sure,
but I think there is no reason it shouldn't.
If you don't have access to www, write me,and I'll send you the copy of the
program.

Bye

Or, if you are MS-brained, DLL = "Dynamic(ally) Loaded Library".

Either way, it amounts to (almost) the same thing.

> IMO this would be a generalized way of dealing with for example load/save
> modules in image or word processing programs.
> If it's released soon enough, I'll definitely consider using it for the
> module system that will go into the next version of MGIF. Otherwise I'd
> have to write something similar myself.

My TSR is called "The Toolbox", and I've been working on it since 1992.
It became extensible in 1994, and the ability to dynamically load a module
was added quite recently (previously all modules could only be loaded at
boot time).

It was originally designed as an OS-level library of callable code,
then it became a library manager.

It was all written in assembly language, using Devpac 1.25 (from an ST
User cover disc) and now Devpac 3.1 (from Hisoft)

At present, there are some bookkeeping problems with using it in a
multitasking environment (primarily when multiple apps are using one
dynamically loaded extension). It works OK under MTOS with memory
protection.

It requires TOS 1.0 or better, and about 32k of RAM. It works best when
loaded before MiNT, and was designed for the GEMDOS file system, although
it works moderately well when using minix file system under Mint.

I've designed it to have only one instance of any particular extension (based upon a "cookie" identifier within the extensions ID block).

I'm torturing the current version - as well as mulling over the exact format of the extension/toolbox interface. The "calling the extension" is fully working, but the extension ID block needs work.

There is a built-in limit of 16 extensions loaded simultaneously - but this limit will be raised soon.

It lacks RPC functionality, though. I'd like to add that later.

It still has an assembler level interface in terms of the startup code, and I haven't tried to make it "Lattice Friendly", so you can write extensions in a higher level code (you'd need to make a few changes to the startup stubs and initialisation code, as well as setting the base register [generally A4] on entry to any funcs that needed it when using a base-relative compiler mode).

If you are interested in taking this further, I'll start a "Toolbox API" thread in c.s.a.p and we can nut out the details to form an "open" standard calling protocol.

Source record: 17818

I have a Mega STe with internal Atari interface for scsi hd . Some time
ago I replaced the original Seagate 157N hard disk with a Maxtor 210 . For
install it I used the ICD utility version 3.54 .
After some times I tried to use again the original HD , but both ICD
utility and Atari HD utility cannot find it during the scsi device
presence check .
Now the maxtor is broken and I have tried to use again the original Seagate , an
IBM 310 Mb and also a Quantum 80 Mb , with a lot of different utility ,
but with no success .
Can someone help me ?
I must use only some kind of hd ?

Many thanks .

742. Eureka a graph describer and 3D modeler

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-03 00:00:00 UTC
From: lecoat@chronos.ief-paris-sud.fr
Message-ID: <5feh8c$kaq@upsn6.u-psud.fr>
Source record: 17823
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.programmer

Hello everybody,

I'm a french developper working on a program called Eureka 2.12.
It's a 2D numerical analysis program, and a 3D modelling of
mathematical shapes. It also includes 4D presentation, because
a time parameter is available. It's quite easy to make movies
showing the evolution of a formula in 3D rotating, morphing from
a shape to another etc... Data files can be loaded so that you can
manipulate series, or even stereo/mono sample files manipulating
sounds. Images can be produced, computing them with formulas to
draw fractals such as Julia or Madelbrot sets. You can even map
these images on a 3D surface, producing impressive representations.
Since recent revision of my program it is now in two languages
French and English. The english translation of the documentation
will be soon available. My goal is to make a program like some
on other platforms such as Mathematica or Matlab. It has been
tested with success on MAGIC, TOS2WIN, STonX and MAGIC MAC/PC.
There may be remaining incompatibilities that I wish users to
tell me about. So don't hesitate to mail me ...
My work is a complete package including the program and some
accessory like a snapshot, an unusual recording accessory that
allow you to demonstrate the program like a mecanical piano would
play Stravinsky (?). There's a program that can show your movies
etc ...
The latest english version is available on my home page at :
http://www.ief.u-psud.fr/~lecoat/
That page is mainly illustrated with my program so that you can
see what is possible to do. Eureka has 3D2 Raw and VRML exports
so you will see Virtual reality demonstrations of objects, and
movies or images produced with Persistence Of Vision.
The latest revision will also be available soon by FTP on the
"Conservatoire National des Arts et Metiers" at :
ftp://ftp.cnam.fr/pub/Atari/Applications
Anyway for any problem report in my mailbox at :
lecoat@ief.u-psud.fr
Any suggestions are also welcome ...
Have fun with my production, bye for now ...

My manual seems to be self-contradictory. There is a SCSI card in the
drive. But as pointed out they are DMA sockets. The manual also seems to
imply that the Atari range of computers uses the SCSI protocol.

From: jmirando@streport.com
Message-ID: <5fg7e0$9q9@news2.delphi.com>
Source record: 17825

Could someone please enlighten me as to how these TOS images are loaded into an _ST_?

I have a MegaSTE (2.06), a Stacy (1.04), and a 1040 STE (1.6) and would like to be able to load Rainbow into either the STE or MegaSTE for compatibility.

I've gotten TOSDUMP and made an image of 1.4, but when I try to load it into either of the other machines using QuickTOS, it bombs out.

Is there a special loader required?

Thanks,

Wrong company.
Try Novell who bought up Digital Research who liscenced GEM from Xerox(PARC)
When I used Ventura I was using GEM, and also GEMPaint, and GEMDraw.
If you can find a 2nd hand copy of Ventura, or GEMPAint, or... then you will
have the GEM system running on top of DOS. Not as good as GEM/TOS IMHO.

>Anything you like.

I'm speaking a bit from ignorance as I don't know the Gasteiner
Drive - but be careful. If the bare drive you want to drop in is a
modern drive (scsi 2 or 3) that requires arbitratioin and the existing
driver software doesn't support that - then you probably don't want
that particular bare drive or you will want to upgrade your driver
software.

It's also worth considering parity of the drive depending on how
the Gasteiner Drive handles that. Some bare drives have their
parity set in software and we don't have many drivers to handle
that on the Atari.

Hello,

does there exist software so that I can use a parallel zip-drive with
my Atari 1040 ST? Please answer by e-mail because I don't read this
group normally.

Thanx in advance
Gerald

If you get a cartridge, you used lower-case "c" instead of an upper-case
"C" when installing the icon - TOS is hard-wired to use the lower-case "c:"
device as a cartridge.

Actually, all Falcons (real Falcons designed by the guys in Sunnyvale,
anyhow) have an internal IDE port and an external SCSI-2 port, along with an
Appletalk-compatible LAN port (which is probably right next to the MIDI
ports, but sicne my Falcon still hasn't arrived, I can't verify that).

>There's a possibility I may need a
>new board. However, once I get it up, I will connect the SCSI drives to

>the Falcon and SCSI drives? Was it HDriver?

AHDI was provided by Atari, but I highly recommend purchasing HD Driver as
soon as possible. Mine arrived last week and, even if it didn't have so
many other cool features, the bootup speed is a good 30 seconds faster than
AHDI. You can get HD Driver in North America from Computer Direct (see my
"vendors" page for their URL).

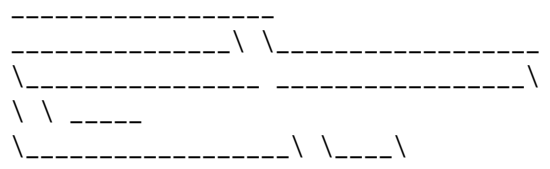
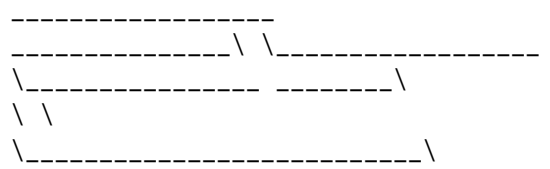
Not really. I long ago gave up worrying about it and simply cut out the
opening a little further so that instead of the original appearance:



now it looks like this:



I think I have the slants backwards there, but you get the idea.

>By the way, what about ICs on the Atari STe motherboard- are there any
>chips that might have "blow up" which only affects the disk drive?
>I've already checked the WD-1772 (I also have an AJAX) and it seems OK.

Seems to me that the Yamaha sound chip is also involved. I had to replace
one once when I couldn't access the floppy drive.

From: dipching@ping.be
Message-ID: <857504166_OASIS_@ping.be>
Source record: 17836

How can I achieve to put my second (external) disk drive in my towered
TT ? I must absolutely know how to convert the flat internal connector
(disk drive) to the circular one (external plug of the drive).
When I will know the exact connections, I will solder all the wires
inside de motherboard behind the genuine external circular connector.

Please is there someone who could help with this conversion ?

> 2 basic questions:
> a) Just what is DMA out? - like has it been 'scuzzified'?

Hmmm. I would assume that the DMA(ACSI)-SCSI convertor card is inside the
Gasteiner, and that if the 'out' port on the Gasteiner box was SCSI, it
would say SCSI out instead of DMA out, so possibly it just passes the
ACSI-DMA siganl from the Atari straight through, bypassing the SCSI adaptor.
If you open it up, you would probably be able to tell from the wiring.
My Megafile had 2 outs, one SCSi and 1 ACSI (of course it had been hacked
before I got it). I'm just guessing though as I've never had the honour of
owning a Gasteiner, shipping it alone would break me. :^)

> b) So i rip it to bits to add another bare drive - what can go in
> there? I assume this is going to be easiest as I just plonk in
> a suitable scsi jobby? Will the PSU in there hack it?

Power requirements are usually listed in the hard drive, so add 'em up! :^)
You might need a new SCSI ribbon cable to attach the 2nd drive also, tho'
maybe the cable that is there already will have the pins on it to plug in
another drive. Any SCSI drive should fit in, provided it is physically the
right size anyway, I don't know what is inside in the way of mounting the
drive though. But then you won't either until you open it up! :^)
So tell us what it looks like inside.

>All I know is that my UNIX host is using LYNX (of course).

Actually, Terry, if you have a shell account (which you apparently do, since you can run lynx on the server), you should be able to enter "irc" at the command prompt and get in that way. If you want to connect to other than whatever your service has set up as the default irc server, you can enter it on the same line, e.g.:

irc irc.warnerbros.com

should get you into the Warner Brothers IRC site.

This is not necessarily the best way to use IRC - but it may be the easiest for people who have shell access already.

>This would of course be the cheapest and quietest way if the Falcon
>could safely handle it...

Bad idea, IMHO. As cheaply as Atari tried to make things, I seriously doubt
there would be a fan in the Falcon if it wasn't really needed.

>2) Fan regulator. I read some german docs about installing regulation

>my german is far from perfect. Has anybody installed some kind of
>regulation (or a completely new regulated fan)? Does it take down the
>noise and is it expensive or hard to build (I do have some experience
>with hobby electronics)?

Possible, but I can't tell you how much it would help - my Falcon still
hasn't arrived.

>3) A new, quieter fan. I just don't think that this would help things
>much... Of course, I'd be glad to know of a replacement fan if it
>really is noticeably quieter...

Another possibility - if the Falcon fan is behind a louvered plastic panel
(as the fan on the Mega ST, TT and MSTe is), you can use a sharp hobby knife
and remove every second plastic strip to increase airflow and decrease
resistance - that should also reduce the noise level, but if it doesn't, it
is then possible to lower the fan speed by 50 percent and keep the same
amount of ventilation due to the larger cross-sectional area of the fan
opening.

761. Do I need a new Yamaha chip? (diskdrive problems)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-04 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <331c81e68f285@sn.no>
Source record: 17841

As the subject says... do I need to replace my Yamaha (forgot the number) sound-chip in my STe, as my disk drive has apparently "died" some way or another.
It could ofcourse be the drive itself, but if not- someone has suggested that the Yamaha sound chip might be the problem.
How would I go about testing this chip before I waste a lot of money (and time) on getting a new one if it in fact is perfectly OK?

The sound on the machine seems fine, and everything else works- modem/printer/harddisk/monitor/mouse/joystick.
What other chips could have gone bad which affects the disk drive?

Actually the problem happened all of a sudden. I was reading a disk and got the message that it was unreadable. I accepted that, because I suspected that disk to have some read-problems, but when none of the other disks worked either ("disk drive is not responding") I understood that something was wrong.
I checked the disk-controller by exchanging it with another one (I have a WD-1772-02-02 as well as an "AJAX"), neither of them resolved them problem.
I also cleaned the disk-drive's head, but that didn't change anything.
I might add that the drive is accessed as before. It's just that it doesn't seem to be able to read/write/format any longer.

Any ideas/comments before I start forking out cash to exchange parts that might be in perfectly good order?

Hallvard

That depends on the SCSI hostadapter you use. With the LINK96 host
adapter any SCSI drive can be connected to the ST/STE. With other host
adapters drives like the Quantum Fireball, which needs initiator
identification, won't work.

From: Jean Marie Bussat <bussat@lapp.in2p3.fr>
Message-ID: <331D7B0C.3F88@lapp.in2p3.fr>
Source record: 17750

Hi,

I don't remember if floppy related things are the same in a
STE but for the STF I can say the following things :

- Most of the job is made by the WD1772 (floppy disk controller).
It convert data from (to) the floppy drive in a usable format.

- Then all datas go through the DMA controller. This Atari custom
chip also drives the hard-disk.

- The sound-chip (Yamaha YM2749) is only used to select the right
floppy drive and the right side of the disk. (It also drive the
parallel port and some lines of the RS232 port).

So, if your hard-disk is working well, there is probably nothing
from the DMA chip.
If you can print without problems and sound is OK, check the
drive select LED. If it lights each time you are trying to access
your floppy, your sound chip may be OK too.
You said that there is no changes if you replace the floppy
controller, so it may be OK.

It's all I can say. Try to replace the floppy drive (try to ask
for a friend's one before buying a new drive).

Hope this helps (perhaps there is not a lot of differences
between STE and STF for this part).

Connectors:

34 way connector on floppy drive (5.25 card edge - 3.5 pin header)

```
.___.
Ground 0v 1| |2 Reserved (High Density Detected on some HD
drives)
Ground 0v 3| |4 In Use/Head Load/Open
|---| keyslot only on 5.25 disks
Ground 0v 5| |6 Drive Select 3
Ground 0v 7| |8 Index Pulse Sensor
Ground 0v 9| |10 Drive Select 0
Ground 0v 11| |12 Drive Select 1
Ground 0v 13| |14 Drive Select 2
Ground 0v 15| |16 Motor ON
Ground 0v 17| |18 Direction IN Select
Ground 0v 19| |20 Step Pulse
Ground 0v 21| |22 Write Data Pulses
Ground 0v 23| |24 Write Gate
Ground 0v 25| |26 Track 00 Sensor
Ground 0v 27| |28 Write Protect Sensor
Ground 0v 29| |30 Read Data Pulses
Ground 0v 31| |32 Side ONE Select
Ground 0v 33| |34 Drive Ready
---
```

All signals are active LOW ie the signal is normally high (for example
to switch the Motor ON signal active, pin 16 should be connected to 0
volts).
So be careful plugging in the cables.

Male Power connector on drive

```
3.5 5.25
---.
|o / o | pin 1 +12 volts DC (may not be required by disk drive)
```

```
|o | o | pin 2 0v
|o | o | pin 3 0v
|o \ o | pin 4 +5 volts DC
---

Cable connections for external floppy drive.
14 pin TT 34 way IDC
pin no pin no
1 <---------- 30
2 ----------> 32
3 ---------- 1,3,5,7 etc (any odd numbered pin)
4 <---------- 8
5 ----------> 10
6 <---------- 2 (for use with a High Density Drive? )
7 ---------- 1,3,5,7 etc (any odd numbered pin)
8 ----------> 16
9 ----------> 18
10 ----------> 20
11 ----------> 22
12 ----------> 24
13 <---------- 26
14 <---------- 28

To connect two floppy drives internaly in a tower cased TT computer,
use the following simple cable:-

34 way flat cable connector on motherboard.
|
|
34 way flat cable connector to 1st Floppy drive.
|
|
34 way flat cable connector to 2nd Floppy drive.

The floppy disk drive mechanism should have internal jumper positions
to select the drive required. For drive A the Drive Select 0 jumper
should be made, and for drive B the Drive Select 1 jumper should be
made.

A single wire modification is required on the mother board to connect
the drive 1 select (D1SEL) signal to the 34 way motherboard connector,
as this signal is only connected to the 14 pin floppy connector.
Connect 34 Way pin 12 to U406 (26LS31) pin 6 or RP41 pin 4 (1K pullup).

This is probably the easyest way to do it as the flat cable is easily
made with the IDC connectors.

regards

Have you tried changing the seek rate for your floppy drive before starting
the programs? I'm going by memory but I believe that a program you can try
is DCBOOTIT by Double Click (check the UMICH archives for the proper
program if I have it wrong.) Run the program and change the seek rate for
the floppy and then have it re-boot. I remember having to do this with
some programs after I put TOS 2.06 and a HD floppy into my MSTE.

Should be OK since the drive gets accessed as before, and I've also tried it with an AJAX chip, with no difference.

>- Then all datas go through the DMA controller. This Atari custom
>chip also drives the hard-disk.

This one should be okay, because I use my harddisk every day and I've had no problems with it.

Well, the modem works fine as well, as does the printer.

Yes, the drive behaves like before. The "in use" LED lights up when the drive is accessed, with the only difference that the disk can't be read (seems like the disk is damaged or something, but this happens with all of my disks!).

>You said that there is no changes if you replace the floppy
>controller, so it may be OK.

I hope so. The AJAX chip I got cost me a lot of money.

>It's all I can say. Try to replace the floppy drive (try to ask
>for a friend's one before buying a new drive).

Yes, I think that's the way to go. It seems that the problem is with the drive itself.

>Hope this helps (perhaps there is not a lot of differences
>between STE and STF for this part).

I don't think the differences are that great. I'd go for the explanation
that my drive is dead. Thanks for the info.

> > idea on how to connect the two together.
> >
> > Anyone know how I can do this?? Or if it is possible at all? I don't want
> > to fry the serial chip on the falcon :)

Just get a Mac-to-PC null modem cable. Or if you want pinouts:

mac serial port:
(printer end)
mini-circular-square-din-type connector

U
8 7 6
5 4 3
2 1

1 handshake out (DTR?)
2 handshake in (RTS?)
3 TD-
4 GND
5 RD-
6 TD+
7 GPinput (NC on Mac plus and earlier)
8 RD+

This is an RS-422 interface not RS-232, hence the paired IO pins (+ and -).
To connect to an RS-232 device: attach the - pins to the RS-232 data
pins, and RD+ to ground. The handshake in and out are the hardware flow
control, GPinput is carrier detect.

Check out http://csgrad.cs.vt.edu/~tjohnson/ for a very comprehensive
pinouts list...

1 meg 30 pin no parity is perfect. Parity SIMMs will also work but the parity
bit is ignored.

Put the 1 meg SIMMs in the first and third slots. It is sort of possible to
use 2.5 megs. but you'll need a patch (I can't recall the name right now) and
it doesn't work very well. RAM prices for 1 meg SIMMs are at a long-time low
- why not get 2 more megs?

>
>Internally(rather) or externaly? How?

I'm assuming you mean a Mega ST2. Get the ICD Micro host adapter and a
3.5-inch SCIS hard drive - be sure it is NOT a Quantum Fireball or other drive
that requires initiator identification, and make sure that parity is set to
OFF or can be disabled with a jumper. Almost any Seagate drive should work
(if you want lots of space, get a Seagate ST51080N - it's only 1 cm thick and
has just over 1 gig capacity).

Externally is easy - I think the .se domain is Sweden, so contact Hallvard
(look in this newsgroup) and ask him where the nearest deal is for plug & play
Atari hard drives.

Not STE, but Moonspeeder on the Falcon supports an analogue
joystick.

AFAIK only really Moonspeeder (and probably Moongames). I _think_ the
version of breakout supplied with the Falcon supports an analogue paddle
but it's such a poor implementation of the game that I wouldn't bother.

Analogue inputs will be covered in reasonable depth a little later in
my series in Atari Computing, so hopefully we'll start to see a slight
increase in their use.

Cheers,

Xav

782. Taylor UUCP problems

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-06 00:00:00 UTC
From: jmf@informatik.uni-koblenz.de
Message-ID: <5fmhuudn2@newshost.uni-koblenz.de>
Source record: 17763

I am using Taylor UUCP 1.03 for the Atari to connect the ST to a PCS Unix system running BNU UUCP.

However, when the BNU uucico tries to connect the ST, I get the "WRONG MACHINE NAME" message.

The UUCP Nutshell book says:

The [...] message is produced by the Master when the hostname in the "Shere=hostname" message from the Slave is not the same as the Master thought it was calling. If this check fails, the Master [...] hangs up. This check [...] does not work if the Slave uucico is too old to put its hostname on the "Shere" message.

Is there a possibility to get this straight with Taylor UUCP 1.03? Or is there a newer version of the package?

Tschuess

783. CBHD 5.02 & ZIP Help!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-06 00:00:00 UTC
From: allmidd@xs4all.nl
Message-ID: <5fms8vfkt1@news0.xs4all.nl>
Source record: 17764

I own a MEGAST (16 Mhz), a LINK II and a Quantum Ligthning 540S. I use CBHD 5.02 as a HD driver. So far I'm happy.

Now I got the brilliant idea to buy a ZIP drive and put it behind the Quantum in the chain by means of a 50 to 25 cable. Of course I put ZIP termination to on.
It won't work! CBHD even doesn't recognize the ZIP drive, ti does not recognize any drive at all..
So I tried HDdriver, the Demo version, willing to change drivers. It won't work!
Then I booted with ICDboot 6.5.5. At last both drives were recognized but that's about it. Strange indications of of my HD partitions appaer. Appently there are read errors.

Any idea's

Johan

Hello, I have just put a PC power supply in my TT or ...
I have just put a TT in a tower with a PC power supply ...
because it don't fit in the TT !!!!!!

No problems for the connections, PC power supply connectors are
divided in two parts ... on the TT only one large connector ...
But the voltage is exactly the same as provided in the TT (or even
Mega STE ...) You must be carefull by connect them two, because the
black wires must be at the center, orange wire is in front of your TT
mother board ...
So let's go, buy a PC power supply, the only problem is to put it in
the box or to put the TT in one other kind of case !!!!!! Pleasure
garanted ...

786. Need help with 520ST problem.

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-06 00:00:00 UTC
From: djc126@alf.usask.ca
Message-ID: <5fnloa$rq@tribune.usask.ca>
Source record: 17767

Here's a question for everyone:

Do you have an older 520ST(built-in TOS 1.0) that works fine but doesn't recognize the external floppy drive?

I have one that exhibits this problem in addition to the screen going white and the machine bombing periodically.

I'm thinking that it's the WD1772 drive controller chip but have also heard that these older machines just
need the chips reseated. It works fine with a hard drive otherwise.

I've reseated all the chips but still experience this problem. Any ideas?
Could it be a video shifter chip problem?
Thanks.

>inside de motherboard behind the genuine external circular connector.

You don't need to convert the DIN cable to ribbon - just use a PC ribbon cable that's already equipped with two floppy connectors. If for some strange reason the B: drive doesn't get recognized, then consider adding a single jumper from the DIN port to the 34-pin male header to be certain that the DS1 line is connected (I know for sure that DS0 is, as I'm using this arrangement with my TT server now - but I took the B: drive out since I never use the second floppy anyhow).

Pinouts for the ST/TT floppy drive port are at ftp://ftp.teleport.com/users/atari/pinouts.zip (along with all the other TT pinouts). Pin 5 on the external floppy port corresponds to pin 10 or pin 12 on the 34-pin header; use a continuity tester to see if it is already connected. Pin 12 is where you want it to be.

Hello,

Due to the death of my father, I have a lot of Atari equipment for
sale. I have prepared an itemized listing of all the equipment. Please
e-mail if you are interested.

Thanks,

Jayne

COMPUTER ITEMS:
FOR SALE
QTY DESCRIPTION ASKING PRICE
1 ATARI MEGA STE 68000, 16MHZ COMPUTER (16 BIT) 4M MEM.INTERNAL 3.5 HD 1.4 FLOPPY;
TV/MONITOR HOOK-UP; KEYBOARD & 2 MICE; EXTRA 1M MEM; 3.5, 720K FLOPPY W/ ROMS; 2 SERIAL/2
SCSI HOOK-UPS $150.00

1 ATARI, IB DRIVE EXT. 5 1/4, 360X FLOPPY $ 40.00
(EXCELLENT FOR PC-DITTO (IBM EMULATOR))

1 ATARI MONO (720X348) B/W MONITOR $ 50.00

1 120M SCSI ATARI EXTERNAL ICD HARD DRIVE $150.00
W/ICD INTERFACE & CABLES

1 ATARI SLM804 LASER PRINTER. W/DRUM & TONER $150.00
W/SCSI INTERFACE & ALL CABLES

1 MIGRAPHS (LOGITECH) ATARI HAND SCANNER $ 80.00
W/SOFTWARE

2 SPECTRE ATARI (MAC) CARTRIDGES & SFTWRE $ 50.00

This is the perfect DESKTOP PUBLISHING setup as configured. HD has CALUMUS & PAGESTREAM;
G-DOS ~ ULTRASCRIPT; POSTSCRIPT FONTS; IMG, TIFF, GEM, EPS, FONTS & GRAPHICS. WORD PERFECT
4.1 FOR THE ST, ATARI WRITER-ST, & TEXT EDITORS. PC-DITTO (IBM EMULATOR) SOFTWARE, PC DOS
3.2, GEM 3.1 FOR DOS. MAC SOFTWARE, & MAC SPECTRE EMULATOR CARTRIDGES; ALL 10~ DISK CASES
OF SOFTWARE ??

WHOLE SYSTEM PRICE (EVERYTHING) 1ST COME $500.00

SEPARATELY PRICED ITEMS:

1 ATARI 800XL COMPUTER (8 BIT) W/PWR. SUPPLY $ 45.00

1 ATARI 130XE COMPUTER (8 BIT) W/PWR SUPPLY $ 50.00

1 ATARI 1050 DD (8 BIT) W/COVER & PWR. SUPPLY $ 40.00

1 ATARI 850 SERIAL INTERFACE (8 BIT) $ 15.00

1 SUPRA 2400 BAUD MODEM W/PWR. SUPPLY $ 10.00

1 ATARI JOYSTICK (For 8 Bit/16 Bit) $ 5.00

NUMEROUS SPARE CABLES (MODEM; NULL; ETC.) $ 2.00 ea

SOFTWARE? SOFTWARE? SOFTWARE? SOFTWARE?
(W/WHOLE SYSTEM OR SEPARATELY)

10 DISK CASES FULL: ORIGINALS, BACKUPS, COPIES, BLANK DISKS

ORIGINAL PROGRAMS $ 1.00 PER DISK

COPIES OF DISKS, UNMARKED OR BACKUPS $ .25 Ea.

Well there is a slight possibility that the connection you desire is
described in the manuals of the HSMODA07 programm that fixes stuff at the
RS232. Unfortunately the text is in german so I am not sure that it
describes what you want. Anyway if you cant get this file just EMail me and
i will send it to you and if you figure out how to do it don't forget to
tell me how you did it.

: Do you have an older 520ST(built-in TOS 1.0) that works fine but
: doesn't recognize the external floppy drive?

Before I answer this, you'll need to add returns every so often, as it makes the message easily readable.

Now, I had something similar on my 1.0 machine, that the floppy would read only sporadically, and rebooting would either fix it or not. I added a new drive, and that fixed the problem.

: I have one that exhibits this problem in addition to the screen going
: white and the machine bombing periodically.

Could your keyboard be going out? One of my two 1.0 machines had that white screen problem til I swapped out the keyboard. How many bombs does it get?

: I've reseated all the chips but still experience this problem. Any ideas?
: Could it be a video shifter chip problem?

Instead of first blaming the chips, try swapping out the other parts, like keyboard, power supply, that sort of thing. Just the other day, my STe's power supply failed, but not before giving the symptoms of white screen, failing reading the floppy, that sort of thing.

I'd like to see if anyone's successfully repaired their power supply, and what they did.

792. Atari 2600, 5200 and 7800 Junkyard is BUYING

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-07 00:00:00 UTC
From: fxites@aol.com
Message-ID: <19970307081300.DAA03613@ladder01.news.aol.com>
Source record: 17773

Atari 2600, 5200 and 7800 Junkyard is BUYING

Hello All,

This is a little off-topic. Please let me know if this message is unwelcome.

Well, it has been a few weeks since I last did a newsgroup excavation for dirty, dusty, old and musty Atari junk parts. I hope everyone enjoyed their holidays and has great plans for the spring! My plans include fixing up a few more Atari units. :)

My first "dig" revealed a nice stash of 2600 units and a few 5200 bits and bobs, but I still would like to find more! I have made the completely informal price list for the items I am seeking. This list is only to give you and idea of what common Atari junk is worth to me. I might offer more for your junk, I might offer less. But at least now you know whether its even worth YOUR while to propose a deal. And of course, the items that I am seeking are NEVER limited to the items mentioned in this list. If you have ANY Atari related junk for the Atari Junkyard, please drop a note! Thank You!

"Broken", by my definition, is any unit which does not operate as it is intended. "Broken" includes bad A/V chips, funny screen output, completely non-functional units, broken switches, loss of directional control in a joystick, etc... "Broken" DOES NOT INCLUDE units which have suffered any serious injury - such as being run over by Mom's station wagon. Broken also does not include units which users have ATTEMPTED to repair, and then left without necessary parts. If you have fiddled with your unit, figured that you can't do anything with it and put it completely back together again, JUST AS YOU FOUND IT, that is OK. Finally, if you have a box of serious junk, stuff that is left over from an earthquake, or your son's first experience with a screw driver, let me know. I just don't want people pawning off crap parts that they have already DESTROYED as stuff that I could, "really use!"

<NOTICE! These prices are not cast in stone!>
<If you think your stuff is worth more, just tell me so!>
<If I think your stuff is worth less, I'll just tell you so!>

Broken Six-Switch VCS units: $5.00
Broken Four-Switch VCS units: $4.00
Broken 2600 Junior: $3.00
Broken Atari 2600 style joystick: $0.50
Broken Generic 2600 style joystick: $0.25
Broken Atari Video Touch Pad (Star Raiders Pack-In): $1.00

Broken Atari 2600 <insert name>: $??.??

Broken Four-Port 5200 Supersystem: $7.00
Broken Two-Port 5200 Supersystem: $7.00
Broken Atari 5200 joystick: $2.00
Broken Atari 5200 <insert name>: $??.??

Broken Atari 7800 units (all): $6.00
Broken Atari 7800 Pro-Line Joystick: $2.00
Broken Atari 7800 <insert name>: $??.??

Broken Third Party peripherals for Atari Home Consoles: $??.??
Broken 400/800/XE/1200/ETC.: $??.??

SHIPPING is based on a mutual estimation of the real shipping
costs to you. I might jip you on your Atari stuff, but never on
shipping. However, if you're getting $5.00 for something that
was headed for the trash, it is best not to complain. :)

...

So, if you have anything that you would like to dump, please
write me a note. I am not always buying everything on the list,
but I'd love to hear from you just the same. If you have questions
about repairing your own Atari stuff, I am not an authority,
but I'll always give you an honest answer. My passion is keeping
Atari consoles running and in circulation among people who love
them.

I look forward to hearing form you,
Jon Savory

Uhh... it's a Sunday... I don't feel resourceful enough to make a sig.

No Junk Mail Please!
"By US Code Title 47, Sec.227(a)(2)(B), a computer/modem/printer meets
the definition of a telephone fax machine. By Sec.227(b)(1)(C), it is
unlawful to send any unsolicited advertisement to such equipment. By
Sec.227(b)(3)(C), a violation of the aforementioned Section is

Dear Fellow Atarians,

My friend at work has a bunch of 8-bit Atari computers and stuff
that he wants to get rid of to someone who can appreciate them. He is
willing to let them go for a reasonable amount but would prefer to unload
the whole shebang at one go. Here is what he has.
3 800XL's
1 130XE
6 disk drives
2 monitors
3 printers
all manuals and power supplies and cables
His name is Bob Salopek and his phone # is 415-333-2165.
Please do not e-mail me as I can't help you out on this. Just call him
and negotiate directly. He has no e-mail address so you must use the
phone to contact him.

Happy Shopping

What operating system do you use now? Magic doesn't like the ICD partition
system and I never did get HDX to work.

Alternatively, you may not have made your connections firmly enough - check
them all again.

Have you changed any settings on the dipswitch block on the atari host
adaptor? They should all be "On" IIRC.

f> I must use only some kind of hd ?

3.5" SCSI 1 or 2, with parity disabled. That's about it.

Regards, Harry Sideras - UK Association of Atari User Groups

FWIW, I just replaced the drive in my Falcon (which arrived yesterday - it seems there was a child's toy lodged in the drive, and in the process of removing the toy, I broke off one of the drive heads). The behavior of the broken drive was identical to what you're telling me here, so I leave it to you to draw your own conclusions.

As with all the 520st machines, the damn TOS chip sockets are bad.
I have found it is usually the first two top chip (in a 6 chip set)
that have bad contacts. Carefully use an eraser and clean the chip
leg of corrosion reinsert and try again. The six inch drop is next
if need be. I have had good luck with $0.06 new sockets that I put
the TOS chip in and then put this new socket in the old. The only
real cure is to desolder and put in new sockets on the motherboard.

(or better yet, just buy a 1040 cheap and throw the 520 away).

Good Luck.....

798. PC power supply on ST

I've tried changing the step rate long ago - it's nothing to do with that, but I
have found a solution anyway (using a disk version of TOS 1.4!)

Excellent!!!!
I just had a look at it (and naturally downloaded the information for later
reference), and I'll definitely be adding this link to my Atari page.

For anyone not understanding what the "Atari ST Internals" page that Rick
refers to is, it's a technical reference manual for the STFM/STE over all
the hardware and system calls etc. Very useful!

Yes, I think the drive might be the offending part, and I'm now in the
process of searching for a new Sony drive to replace it.
I'll need one anyway, to complete my research for my HD disk drive upgrade
documentation which I'll be putting on the net when I succeed.

I have just bought a 15' Apple monitor to use with my TT030 and its
Crazy Dots Graphic Card ... everything is going very well ... except
that no "curved/rounded" picture control exists on the monitor ... and
obviously I obtain "curved/rounded" picture in each resolution I choice
Is it normal there is no control dedicated to this problem on the
monitor ? Apple Multiple Scan 15'AV.
Is it possible I can find this control inside the monitor ?

I think you'll have more chance of getting a useful reply to this if you
ask in a Macintosh group. It's probably the monitor itself and not the
connection to the TT that makes it behave like this.
Have you tried it on a Mac? Same results?

This is an indication for something wrong with termination or cable
connection. Try better and/or shorted cables.

There probably is a control inside the monitor, but unless you know what
you are doing, I would advise you to take it to a repair shop. Due to
the high voltages inside monitors you risk electrocution.

Sam Ellis.

It's worth checking the drive by trying to format a new floppy.

I had a really strange problem where the drive appeared to read floppies
ok, but when you wrote files, they were often corrupted.

The drive was often unable to produce an error free disk.

I finally traced the problem to a cable fault, specifically the side 0/1
selector line. SS formatting worked fine, DD did not.

I found the signal was attenuated when it got to the drive, so the side
select was not working.

The cable started to fail after I replaced my original SS drive, I
probably damaged it as it had to be twisted 180 deg. to work with the new
drive.

I guess it is about the same as everywhere else with central heating
:-) Come to think of it, probably warmer than in the U.K. - the houses
are generally a bit more sturdy here than there...

Of course I am not using my Falcon outdoors inside an iglu! (No - we
do _not_ have iglus here in Finland.)

I have an STFM with TOS 1.2 and an STE with 1.62. I have made a TOS image of the 1.62 ROM. How can I make the STFM boot with the 1.62 TOS image ? Does the ST check on the boot disk in search of a TOS file ? How should I name the file so that the ST recognizes it ?

Another question:

The STFM has a 6 chip version of the TOS 1.2. Can I put the 2 chip 1.62 version in two of the sockets and have the STFM recognize them by setting a jumper on the board? Or will I have to write the two chip 1.62 onto 6 EPROM chips ? How would I do that?

816. Missing Crystal ?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-10 00:00:00 UTC
From: bales@garonne.stortek.NOSPAM.com
Message-ID: <E6u0z9.D7G@gazette.stortek.com>
Source record: 17651

Taking a look at an old issue of ST Format that described the inside parts of the ST, I noticed a few things in comparison with my 2 actual STs:

-STFM was always supposed to stand for ST (integrated)F(loppy)M(odulator). As a matter of fact all STFMs don't have the RF Modulator. French models (like mine) don't have it because thay were sold with a SCART/Peritel cable that plugged directly into the monitor port. The modulator part of the board is completely unpopulated. The 'M' is still on the label underneath the machine though. I guess it just stand for the generation it belongs too.

-My STE doesn't have this either, but what bugs me a little bit more is a zone to the left of the GLUE/MMU/Blitter chip (I think), which is also unpopulated. This part was labeled on the ST Format maps as being the 'System 32Mhz Crystal which is necessary for keeping the ST in sync with itself'. I suppose thay were wrong on this because my STE works perfectly well without the stuff. So the question is, what is this part that is missing on my STE's board ?

You can't unless you have a piece of software to go through the TOS image and relocate every single address in it to an appropriate address in RAM and load the image to that area. Off hand I know of no such piece of software though I remembering hearing something about one being developed a few years ago.

> Does the
>ST check on the boot disk in search of a TOS file ?

No.

Dunno, I suspect not.

> Or will I have to write the two chip 1.62 onto 6 EPROM
>chips ? How would I do that?

Start with an EPROM blower I suppose, and see how TOS 1.02 is laid out on the current 6 chips...

Source record: 17655

Yeah, I've got my ST setup that way. The Atari connector is (from
left-right on an old ST):

+5, +5, GND, GND, GND, +12

I don't know the pinouts on the PC connector (its got more than you need)
but Red is always +5, Black is always ground and Orange is typically +12V.
Your best cross-check for that is to look at the disk/hard drive power
connectors on the PC supply -- all they contain are those three volatages
where +5 is always red, GND is always black and 12V is the other one.

Well, actually, yes, in a manner of speaking. If there is a bootable boot
sector on the disk in A:, it wil be executed - so if you happen to hae a
bootable TOS disk in there (TOS 0.98, or one of the developer's versions of
later TOSes), it will load TOS from floppy. However, that's not the same as
loading a ROM image - not even really very close.

I can't help with the monitor, but I would say that it isn't 'normal' to have
curved edges to your display with your card. I get it on my Iiyama 15" as
well in the more extended resolutions, but certainly not in every one - maybe
just 20pc of them.

: Dunno, I suspect not.

Toad and some other companies have a 6-chip version of 1.62, so you can
most easily use that. I've seen no jumpers to set on an STfm, though I
have two of them, using two different boards, though there are on an STE.

Try this: ftp://ftp.teleport.com/users/atari/pc_st.zip

Note that the problem is NOT the disk format - it's M$'s brain-dead DOS.
The formats are identical - but M$-DOS decides that a disks is
blank/unformatted if it doesn't have those little "this disk was formatted
by a Bill Gates money machine" identifier bytes in the boot sector.

I'm sure that I had such a utility that would allow you to do this but I
can't find it now :(Gemram does do this but takes up about 700k so I
am told but ifyou don't mind that then it's quite easy to get hold of.

> > Does the
> >ST check on the boot disk in search of a TOS file ?
>

Not 100% true, the St does indeed check for a bottsector that will
automatically load TOS as used with TOS 1.0 thus the very long wait when
you boot up without a floppy.

Were these diskes formated on the Atari STe? All versions of TOS starting
with TOS 1.04, Rainbow, and there after, do proper DOS compatible 720k and
should be readable by any DOS machine. Your problem may be with the fact
that you are trying to read them with a 1.44 drive. Try a differient PC.

The Lighthouse Tower comes with a gadget for the ST that hooks into the floppy cable and allows for two floppy drives connected to the ST motherboard in the Tower. Maybe someone can say whether it will work with the TT.

BTW, I have one and don't need it, I'm putting my Falcon in the ST Tower.

Done! Posted and mailed.

The PC power supply will work fine. Make sure the black wires (ground) are in the center of the connector - that's all there is to it. FWIW, the TT motherboard fits comfortably in the "super server tower" sold by Lightspeed Systems in Houston - that's how STarship BBS is set up.

As far as I know the LINK96 host adapter is also available as an
internal version. (norwiecz@aol.com surely knows the details.) In this
case the Quantum Fireball can be used like any other drive.

Yes you can use a 2 chipset version of tos in place of the 6 chipset. It requires soldering a couple of jumper pads and the addition of a 7404 chip. Some where I have a file that explains how to do that on all the models of the ST's. If you would like a copy, let me know and I will dig it up and send it to you.

He shouldn't have any problems reading them on a normal PC. I format 720K
and 1.44 alternatively every now and then. If I format it 720K on my PC,
then it's readable on the STE with no problems. However, I have slight
problems if I format it 720K on the STE and have the PC read it. Sometimes
it donesn't always read it.

I've used a null modem between both systems. No errors at all.

It's possible to format a 1.44 disk as a 720k, but then some PCs will have
trouble reading the disk unless you cover the "high-density" hole with
tape.

If you are extremely lucky, you will have the same revision mother board
as my first STf! It didn't have jumper as such, but did have solder pads
that could be changed enabling the rear most 2 sockets to be used for
the 2 chip version!

Tos 1.62 is for STe, try 1.4 instead. You can install either 2 or 6-chip TOS into your ST, you'll just have to solder a thing or two to do (I suppose there are 3 (?) solder points marked 256 and 1mb, which you will have to chance).

Not that I'm aware of, you have to put the executable bootsector on yourself.

You can download my previous schematic at

ftp://lappsun11.in2p3.fr/pub/jmb/st_power.txt

Feel free to ask for further information.

Hope this helps and that will be more readable.

Message-ID: <5g314m$p5v@ash.ridgecrest.ca.us>
Source record: 17677

I spent a few hours crusing around for an FAQ on the TT,
but never found what I was looking for.

First, does the TT bus run at 16MHz?

Second, I assume that the keyboard and MIDI chips
run at the same speed as on ST's and Falcons, right?

Third, does anyone have information on how the video chip
works on the TT? The Falcon uses two clock signals to
get different modes. Where does the video clock originate
from (like the Combelon the Falcon)? Are there any details
posted about the chip somewhere I missed?

Fourth, does the DMA run at the bus speed? Does the SCSI
controller get it's clock from the DMA chip, or off the
bus clock?

Thanks for anyone that helps,

Mike

Hi,

On the subject of using STE ROMs on a ST, it isn't very easy
if you don't have the right motherboard revision.

STE ROMs are bigger than STF ones (256Ko instead of 192Ko)
so, ATARI was unable to put them at the same adresses as on
the STF. So if your motherboard is too old, you will have to
add some logic to decode the new adress space (starting at
$E00000 instead of $FC0000). On this subject, there is a
good paper made for TOS 2.06 upgrade that may be usefull to
do this modification since TOS 2.06 also start at $E00000.

I only have a paper copy of it but as far I remember, I
believe that it was called tos206.txt on the server where I
found it.

It seems that newer ST motherboard include this modification
and that you just have to move a jumper.

Hope this helps

Regards,

Jean-Marie

```
m > First, does the TT bus run at 16MHz?

No, 32 MHz.

m > Second, I assume that the keyboard and MIDI chips run at the
m > same speed as on ST's and Falcons, right?

The IKBD is a separate computer with its own clock. The ACIAs use
the same baud rates as the ST & Falcons. I don't know if this was
done using the same clock or by changing the divisor settings
(probably by keeping the same clock).

m > Third, does anyone have information on how the video chip
m > works on the TT?

It gets clock info from the monitor (horizontal sync and vertical
sync).

m > Fourth, does the DMA run at the bus speed? Does the SCSI
m > controller get it's clock from the DMA chip, or off the bus
m > clock?

There is more than one DMA chip in the TT. The ST DMA chip drives
the floppy and ACSI port only, and can only access ST RAM. The SSC
and SCSI have their own DMA chips and can access TT RAM as well
(although the OS doesn't use these DMA chips). I don't know where
the clock comes from.

Sounds to me like you want to replace your clock crystal.

Source record: 17685
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Some revisions of Atari STFM mother boards had solder pads to use a two chip version of the OS, although 1.62 was designed for the enhanced features of the STe computer. The solder pads found on the STfm were for the 2 or 6 chip versions of TOS 1.2,1.4. In this case the jumper pads were named 256/1 meg and were for addressing the larger ROMs 1 meg for the two ROM set and 256 for the 6 ROM set. If you want the enhanced features of a later TOS in an older Atari, use a product such as Compatibility Plus 2. It will allow the use of TOS 2.06 in all Atari 520 through Mega 4's. Please note some soldering is required.

We were talking about this in email, before I realized that this was also in the newsgroup. I'll explain for everyone what we were talking about.

If you have revision B of the ST motherboard, you'll have one row of six TOS chips, in front of the power supply, and the memory is under the supply. Next to the far lower two sockets, are A16 and A17, both marked 256K and 1M, with the 256K part soldered. There's mentioned somewhere that you have to remove the solder from the 256K section, making sure it doesn't make contact at the pad (there's an empty area), and solder the 1M one, so you can use the 2-chip TOSes.

Tom, what else can you say about this?

Those of you who want to put 1.62 or 2.06 in the STf, STm, or STfms, don't. TOS 1.0, 1.2, and 1.4 will comfortably go in them. The STE was made to take the 1.6, 1.62, and 2.06 chips.

Someone correct me if I'm wrong here.

From memory all they do is make an existing bootsector executable (i.e. you have
to put the code on yourself) or they put on some sort of standard bootsector
(e.g. a virus protector).

It would be more correct to say that ANY TOS in EPROM will not plug
directly into old STF/STM/STFM's. The Eproms do not have the same pinouts
as the Atari ROM's.

However, you certainly can modify STF/STM/STFM's to use TOS 2.06 (not sure
if you can use 1.62). The details are in a file (on umich certianly) & the
cost is very low.

861. Specifications for disk drives in ST computers?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-12 00:00:00 UTC
From: hallvart@sn.no
Message-ID: <3326e2062989d0@sn.no>
Source record: 17693

Has anyone got the technical specifications for the disk drives used in Atari ST/STe/Mega/MegaSTe/Falcon/TT series?

I'm working on adapting an HD disk drive for my STe, but as usual the drives bought these days barely have any jumpers. They're just "plug 'n play" for PCs, which can't quite be said for Atari computers.

I'm looking for a circuit diagram for my Sony 520-1 drive, but what I need to know in addition to which "jumper pads" to solder together is what kind of signals/standard the drive has to send/get.
I need to have specifications which I can ask a dealer about. Saying "it's for an Atari ST" just doesn't say enough.

I had problems with my previous Sony 520-1 drive, getting it to work in HD mode (it's broken now, so I've gotten hold of a new one). Someone mentioned that I might have not set it to "intelligent mode" as used in Teac 235 drives. I never got to check this out as I don't know where in the circuit it is. And since PCs use a different standard, what standard does an ST's disk drive conform to?

I would however argue that one of the main reasons and the original use for actually having an executable bootsector is so that TOS could be loaded but it's all about how you look at it, let's just agree that disks can have an executable bottsector which the ST looks for and can be used to load TOS from disk and leave it at that.

My wife's Falcon no longer runs Calamus. It says it doesn't have enough memory although it has 16MB. In addition, MiNT explodes if you try to run it. I think something is wrong in the memory addressing or something. I know it is not the memory card, so does anyone have any idea where to look next? Is there an MMU? What is the U number?

Failing all that, where is a repair facility that is capable of finding and fixing a problem like that?

Also, I have schematics for my old 520. Are they available anywhere for the Falcon?

This seems very subtle for a hardware failure, but I wouldn't rule it out.
Have you tried all of these "first line" efforts yet:

1. Disable all of your auto folder progs and accessories, reboot, and try
calamus again
2. Reload calamus from a trustworthy source media
3. Do a diagnostic scan of your boot media & calamus folders
4. Reset your SRAM to the original settings (there's a utility on Atari
Archive that does this) in case it's been corrupted

Have you watched the memory check at bootup to see if it completes properly?
Granted it isn't a complete test, but it should detect a major problem. The
archives have some more thorough RAM tests as well.

As far as schematics and low-level repair, there is a place that does this
in California -- the same place that bought Atari's remaining stock. Unfor-
tunately I don't have their name/address here at work, but if you send email
to scotty@pagesz.net I'll pass the info back. They sell the service notes
for the Falcon as well, but you'll have to come up with $50 plus shipping for
them.

Good Luck.

Actually, I remember hearing somewhere that some very early TTs came set
for a 16bus, but could be sped up to 32mhz with some jumpers...

These are *software* DIP switches. Software can read these as a byte from
a certain address. (I forget) They have nothing to do with the hardware.
TOS looks at one of these (the second, I think...) which tell it wether or
not to enable formatting 1.44mb disks from the desktop. The rest are
unused, so you can't hurt anything by having them in the wrong position,
since there is* no wrong position... (errm, someone fill in the details... :)

In a normal TT only the seventh dip must be on ... to switch the
floppy drive on High Density if you have one mounted ...
I remember a few weeks ago, people were talking about the others DIP
switches, the first one was for CPU speed ... if you mount a
CaTTamaran inside your TT e.g.
And there was also a third switch used to select DMA sound ON/OFF if
I remember well ...
Then, if you have a normal TT only set the seventh dip switch to ON if
you have a high density HD floppy drive ... the switch also enable to
use a new option "HD" in the format desk dialog.

I have a question about how to blow the TOS.IMG file into a PROM. How
do I do it? All the files I have seen which are used to make blow
proms are plain ASCII files with a hex value for each adress. The
TOS.IMG files looks to be a binary file. So how do I convert it to a
format that my blower understands and where can I get such program?

Nice. Now is there any way we can set up a disk to have such a bootsector.

I have tried Quicktos and haven't got it to work.

Can Gemram be configured to load a TOS image from disk instead of from ROM ?

Find the evaluation version of Gemar, it's perfectly capable. You may
still find that it will have difficulty with your tape drive though. I've
used it on several SCSI QIC drive and 2 different DAT drives on my Falcon.

From: c_graham@patrol.i-way.co.uk
Message-ID: <5g8vgh$fs@lira.i-way.co.uk>
Source record: 17711

Does anyone know the format of Hisoft Exended Debug info
(as generated by Lattice C) - it's no in the documentation
that comes with the compiler. I've managed to decipher
some of the info (source file paths and address's + line
address's), but I need a bit more detail on variables and
function labels.

Reason for this is that I'm putting together a source level
debugger (MiNT only, I'm using the Pexec(mode|0x800,...)
mode to trace with and getting context info via the /proc filesystem).

Any help appreciated, and if someone can forward this message
to HiSoft themselves I'd appreciated it even more....

Sometimes, if you use HD disks, some drives will assume it is ALWAYS
formatted in HD... So you have to hide the HD slot.

> drives bought these days barely have any jumpers.

Why...
Once upon a time where PC and ST. The PC had a shitty 5"25 drive
configured in ID0 (main drive) and the ST a wonderful 3"5 drive
configured in ID0 as well. jealous PC users began then to buy 3"5 drives
as drive B (ID1),then they get rid of the old 5"25 by setting the 3"5 as
disk A... But here is the trouble: 3"5 PC drives are STILL configured in
ID1!
In order to put a PC drive into an ST, you've got to open your drive and
solder 2 pins...Sorry,I can't remember wich ones.

883. Advance Warning: CyberSTrider Closing

Hehehehe... the Subject header made you read this mail/posting didn't it? ;)

Not to worry though as CyberSTrider is only closing for a month and this is advance warning.

Denesh Bhabuta is getting married on 27 March, 1997. Additionally he is moving into his new house around this time. As such, CyberSTrider will be closed and on holiday for a month, from 20 March to 20 April this year.

Registrations received up to and including 14 March, 1997 will be tended to before the 20th. Any received after that date are unlikley to be tended to until after the holiday.

Denesh will also try paying the authors of shareware what they are due before the holiday.

Please note that CyberSTrider will have a new address when it returns. Details will be posted later.

Best Regards
Denesh Bhabuta of CyberSTrider

888. Problem with Maxtor HDD

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-13 00:00:00 UTC
From: djc126@alfonso.usask.ca
Message-ID: <5g9r9u$anv@tribune.usask.ca>
Source record: 17720

Hi. I have a Maxtor LXT-213SY 213Mb SCSI-II drive and have
difficulty getting it to work with my ICD Adsci Plus controller.
I have the jumpers set correctly:
Parity disabled
SCSI ID 0
Terminator set
Using IDCHECK from the ICD Utilties disk, the program reconizes the
drive at ACSI ID 0 and the clock at ACSI ID 6.
However, I can't access the drive at all to format it using either
ICDFMT or HDX 5.0.

Does anyone have a suggestion or is this drive totally incompatible
with my setup?
Thanks.
David

889. ICTARI 44 now available...

Why would you want to do that ?

Tos 1.2 Probabl;y load s more stuff (on an stfm)

thna would TOS 1.62.

Having 2 computers, with 2 O.S's means you can load

more stuff, don't it?

Forget your TOS image, for the time and trouble it will
take (I assume you put a price on your time?) to get
working (being non-relocatable, plus using 256K? of
your free RAM, It's cheaper and more sensible to just
buy new TOS ROM's (or probably a new machine!)

I've gotten a couple more requests for the info, so I'll post it here.
The place that has Falcon internal parts and service manuals (among other
stuff) is:

B & C Computer Visions
1725 De La Cruz Blvd #7
Santa Clara, CA 95050-3011
USA

Ph: 408-986-9960, Fax 408-986-9968

The Falcon manual is $50 there. Save one for me...

I'd estimate that about $500 above his best possible offer, but there
are a number of reasons that might explain it:

1. His wife insisted he sell it, and he doesn't want to.

2. He has no idea what the current market is like (and so won't be
reading this newsgroup, thus is not insulted).

3. Those are Singapore dollars?

What is a *.PDF file from the net?

It is an Adobe PostScript Document Format file. On the Atari you would probably use Ghostscript (3.33 or greater IIRC) to read it. On unix you can use xpdf. On Unix or Windows you can use Adobe's Acrobat Reader. (http://www.adobe.com).

FLOPPY DISK DRIVES

Using floppy disk drives with Atari computers

1) Most standard 3.5 or 5.25 floppy disk drives can be connected to
Atari computers. A total of only two disk drives may be connected one
internal and one external drive. To use High Density drives requires
some work on the ST printed circuit boards and a faster floppy
controller chip.

Newer Atari TT and Falcon computers have Hi density disk drives.

STE Jumpers:
STE internal jumpers W300 1-2 and W301 1-2
external 14 pin FD connector (as shown in the documentation)
pin 5 Drive Select 0 ---- Floppy disk jumper DS0 (Disk drive A)
pin 6 Drive Select 1 ---- Floppy disk jumper DS1 (Disk drive B)

STE internal jumpers W300 2-3 and W301 2-3
external 14 pin FD connector (the default shipping config)
pin 5 Drive Select 1 ---- Floppy disk jumper DS0 (Disk drive B)
pin 6 +5v via 10K resistor ---- not used

2) Connectors:
34 way connector on floppy drive (5.25 card edge - 3.5 pin header)
.___.

```
Ground 0v 1| |2 Reserved (Hi Density Detected on some HD
drives)
Ground 0v 3| |4 In Use/Head Load/Open
|---| keyslot only on 5.25 disks
Ground 0v 5| |6 Drive Select 3
Ground 0v 7| |8 Index Pulse Sensor
Ground 0v 9| |10 Drive Select 0
Ground 0v 11| |12 Drive Select 1
Ground 0v 13| |14 Drive Select 2
Ground 0v 15| |16 Motor ON
Ground 0v 17| |18 Direction IN Select
Ground 0v 19| |20 Step Pulse
Ground 0v 21| |22 Write Data Pulses
Ground 0v 23| |24 Write Gate
Ground 0v 25| |26 Track 00 Sensor
Ground 0v 27| |28 Write Protect Sensor
Ground 0v 29| |30 Read Data Pulses
Ground 0v 31| |32 Side ONE Select
Ground 0v 33| |34 Drive Ready
---

All signals are active LOW ie the signal is normally high (for example
to
switch the Motor ON signal active, pin 16 should be connected to 0
volts).
So be careful plugging in the cables.

Male Power connector on drive
3.5 5.25
---.
|o / o | pin 1 +12 volts DC (may not be required by disk drive)
|o | o | pin 2 0v
|o | o | pin 3 0v
|o \ o | pin 4 +5 volts DC
---

External cable connections
14 pin Atari FD 34 way IDC
pin no pin no
1 <-------------- 30
2 --------------> 32
3 ---------------- 1,3,5,7 etc (any odd numbered pin)
4 <-------------- 8
5 --------------> 10
6 <-------------- 2 (for use with a High Density Drive? )
7 ---------------- 1,3,5,7 etc (any odd numbered pin)
8 --------------> 16
9 --------------> 18
10 --------------> 20
11 --------------> 22
12 --------------> 24
```

13 <-------------- 26
14 <-------------- 28

The terminating resistor pack on the floppy disk drive may have to be
removed.

3) To connect two floppy drives internaly in a tower cased computer,
use the following simple cable:-

34 way flat cable connector on motherboard.
|
|
34 way flat cable connector to 1st Floppy drive.
|
|
34 way flat cable connector to 2nd Floppy drive.

The floppy disk drive mechanism should have internal jumper positions
to select the drive required. For drive A the Drive Select 0 jumper
should be made, and for drive B the Drive Select 1 jumper should be
made.

This is probably the easyest way to do it as the flat cable is easily
made with the IDC connectors.

A single wire modification is required on the TT motherboard to
connect the drive 1 select (D1SEL) signal to the 34 way motherboard
connector, as this signal is only connected to the 14 pin floppy
connector.
Connect 34 Way pin 12 to U406 (26LS31) pin 6 or RP41 pin 4 (1K pullup).

On the STe both drive select signals are availiable on the 34 way
motherboard connector so no modifications are required.

The older 5.25 and 3.5 drive mechanisms were usually well marked for
drive
select, either small pin headers or a multipole small switch.
The newer 3.5 drive mechanisms use a 0 ohm SMD resistor for drive
selection.
They are normally set to select drive 0, so tweezers and soldering iron
are
required!!!

regards

What about the fun of taking up a challenge. I use my Atari as a fun machine,
I use PCs at work (yuk, but I didn't make the company's computer sourcing
policy), so I don't count the time I spend on it.

> Thats interesting. Do you know of any advantage over the Atari > Internal Adaptor.

The internal adapter can't access drives that have parity checking
enabled or that require initiator identification. The latter means that
the drive expects the computer to have its own SCSI ID. For the ST the
LINK96 is the only adapter with support for initiator identification.
And because the LINK96 supports parity as well, it's the only adapter
that can be used for any SCSI or SCSI-2 drive connected to the ST/STE.
Another disadvantage of the internal adapter: You can only connect 1
drive to it. The LINK96 supports 7 drives.

901. Details on the Devpac GST linkable object format needed

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-14 00:00:00 UTC
From: Magnus Kollberg <emwoll@emw.ericsson.se>
Message-ID: <yvvybbqn3aq.fsf@emw.ericsson.se>
Source record: 17733
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer

Hi everyone,

I forward this message for Doug Little. If anyone knows please
answer me directly or post in this newsgroup. It's _very_ important.

Hi,

Does anyone out there know where I can find details on the Devpac
GST linkable object format, or the Lattice Linkable format? I need
22-character linkable output from Devpac, so DRI isn't good enough.

Needless to say, it's not enough just to switch to another linker
which supports these formats since I intend to link with GNU objects,
and so need to write a utility for Devpac->GNU conversion. I already
have GST2GNU.TTP, but it won't read Devpac GST binaries. The Devpac
BIN format is completey different from the one accepted by GST2GNU
(I don't know why). I have examined the GEN output and compared it
with the header structures used in GST2GNU and they are not even
vaguely similar.

Any help would be _very_ welcome.

Doug.

There is already a source level debugger for Lattice. Can't remember
the name of it but you should be bale to get in contact with the
author if you manage to find the package. The only thing I know
about it is that it was made by a swede and the demoversion I
found had a timelimit and it was already activated. Arrrgghhh....

>solder 2 pins...Sorry,I can't remember wich ones.

I already knew this, so that's not the problem. There's only one jumper on
the drive and that's the 0/1 select.
What I want to know is the more technical like specifications of drives
that should work with the ST in HD mode. That is, which standard it has to
conform to, and what is different from standard PC type disk drives.
There *IS* a difference since older HD disk drives had more jumpers than
the newer ones, and they had to be set in a specific way in order to get it
to work.

Now, newer drives barely have any jumpers at all except the 0/1 select as I
mentioned, so I basically have to get my soldering iron out and make my own
"jumpers" on the circuit board (on my Sony 520-1 there are several
connection/solder points marked off, so apparently these are the "jumpers",
though I don't have any way of finding out which one is which and what
for).

I was hoping that I could get some technical specs from someone here taht I
could hand over to a PC dealer to find out what was needed to make the
drive conform to those standards.

Hallvard

yes, yes, yes

>4. Reset your SRAM to the original settings (there's a utility on Atari
>Archive that does this) in case it's been corrupted

I looked to make sure all was kosher, but didn't reset.

>Have you watched the memory check at bootup to see if it completes properly?
>Granted it isn't a complete test, but it should detect a major problem. The
>archives have some more thorough RAM tests as well.

Yep. It doesn't gripe, but the with the speed it can't be thorough.
Actually, I have looked all over for a memory test. I found plenty
for the ST line, but they didn't understand 16MB. You don't happen
to remember a name, do you?

>As far as schematics and low-level repair, there is a place that does this
>in California -- the same place that bought Atari's remaining stock. Unfor-
>tunately I don't have their name/address here at work, but if you send email

>them.

Done. I solved the short term problem by buying another Falcon for
her. (She refused a wintel box ;) and was even cool on using a Mac).
But Falcons are so neat I hate to throw this one away. It could
run linux or *something*.

909. FS: Atari Computer Goods! Some Shown! FREE Catalogs!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-14 00:00:00 UTC
From: bensmith@kelly.teleport.com
Message-ID: <5gd6mgqpd1@kelly.teleport.com>
Source record: 17741
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,abg.atari

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks, Labtec Speakers & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: 1040STF Computers, MonoChrome Monitors, Monitor Master Switch Boxes, Hard Drives, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

>

Yes, there is all the fun of fiddling about.

But in the case of tis TOS image, to make it work I think you'd either have
to

make it relocateable (as I think Damien said) or somehow have 256K of RAM

mapped to where the TOS address is (RAM in the TOS sockets!) Then have a

startup program to load in your image to this RAM.

I've never heard of anyone trying that sort of wild idea.

(...Don't try this at home kids)

******
Other than that I have a program called EASY RIDER which can produce source

code from object files (such as your TOS.IMG). The sources it produces can
usually

be assembled on devpac, then run too!!

But you'd need a hell of a lot of memory to produce a full source listing
of a TOS.IMG!

And wether it would assemble ok a PRG is very doubtful, as the TOS is
usually hard

coded to lie at $FC0000 (or whatever) and some of the code is pretty awful,
using ref's

to these addresses etc. So all in all it still seems a lost cause to me.

Gary.

>EtherNet connection?

Norbert W. is working on it and should have it ready for release by this time; I don't know if IPX/SPX protocols will be readily available, however, but a cheap 386 running as a NetBEUI/NWlink gateway would solve that. There's a link to Norbert's Web pages through mine (see sig below). 10base-T will be the standard. I rather hope he uses ISA or PCI ethernet cards on an adapter, so we can eventually upgrade to 100base-T or even gigabit. I'll be pretty happy with 10 Mbit though - it beats 31k baud.

>Mike

No, the early machines were 16MHz bus and CPU. On the production maodels the CPU was clocked at 32MHz but the bus was unchanged (otherwise it would run a lot faster, or if they had put in a second level cache)

917. Atari Falcon, Cubase Audio Studio System for sale

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-15 00:00:00 UTC
From: michaelk@pacifier.com
Message-ID: <5gf02bijr1@news.pacifier.com>
Source record: 17602

BEST AUDIO RECORDING SYSTEM FOR THE PRICE!!
I am considering selling my master recording system. This
system has worked flawlessly for me and will handle 8 to 16 tracks of
audio. In excellent condition.

16 meg Falcon:
includes 250 meg IDE
Wizztronics DEKA interface for using external keyboard
Honeywell keyboard
All required Steinberg audio & timing fixes have been done
Beetle mouse
SCREEN BLASTER II (for higher screen resolution)
Wizztronic Cart Master LIte (allows plugging in two cartridges at once)
Intel 14400 modem
Monitor adapters for VGA and Atari Monitors

Steinberg FDI (DSP PORT Digital interface for digital recording)

SOFTWARE:
(all are original disks & include manuals)

Steinberg's":
Cubase Audio V2.06
Studio Module
Cue Trax
Style Trax
Data DAt (for backing up files to DAT)

Zero-X (Superb sample esditing program with features similar
to Recycle)
MIdiQuest 4.0
BAnd-In-The-Box

ExtenDOS PRO 2.4a (CD-ROM driver with direct CD record to hard drive)
HD Driver 6.0 (Best Hard Disc manager for Cubase Audio)
ICD SCSI PRO Utilities 6.55 (covers things not handled by HD Driver)
XBOOT (Wonderful program launcher)
Diamond Edge II
Diamond Back III
Pagestream
Calamus
Steno
Stalker
Image copy 4.0
CD-ROMS & MORE software (Falcon games, Utilities, etc, etc)

$1100
or $1230 w/ CTX 15" SVGA Digital Monitor

Buyer pays all shipping costs

BTW: I live in Vancouver, Washington not Canada

I was wondering if anyone could tell me what TEX is?? I see at at the
University of Michegan archives and it appears to be a large program.
What does it do?

Also, can anyone tell me if there is a practical way of
Multi tasking GEM (ie. being able to use Page Steam and a Spread Sheet) on
a 1040STE with 4Mb RAM and TOS 1.6 (without purchasing MultiTOS)? I've
heard of Mint, but you can't multitask GEM programs with mint, can you?
I've also heard of and seen OMEN at the U. of Mich. archives, it appeared
to be a demo, is the actual prg. commercial or shareware? Is
the demo from the archives a multitasking system?

TEX will let your make a document that can be printed at the best
resoluton on any system that happens to run TEX! Of course having said
that, I have to go on and warn you this thing has more bells and
whistles than WordStar, (if you are old enough to remember that monster
of a word processor), it's also just about as complicated to use! Your
docs will be very transportable though!

Yep, there is a demo version of Geneva somewhere on the net, can't
remember where right offhand, but it is the same place as the Neodesk
one and on the page of the company that sells both programs. Give this a
look! If I was using my St's for anything serious, I'd definitely buy
it! Should do what you want though you may have to run the Spreadsheet
program first as Pagestream will try to grab all the available memory.

>I am using DOS/Win3.X and/or Windows95. A reply would be much appreciated,
>here or thru e-mail.

If the disks were formatted on TOS 1.4 or newer, they should be
readable as is. The older TOS's didn't use an IBM compatible boot
sector.

If the disks were formatted with TOS 1.0 or 1.2, you can either copy
the contents to a disk formatted with a newer TOS or even to disks
formatted on the PC.

There are some utilities that will write an IBM bootsector to an
STdisk (DC Formatter comes to mind) but do NOT write an IBM boot
sector to disks with data you want, it will destroy the directories.

I'm pretty sure Gemram can be forced to load from disk as the SHBUF
patch creates a patched version of TOS2.06 and saves it to disk so there
must be someway to load it back up, my SHBUF didn't come with
instructions however :-(

That's not entirely clear. Did you run the utility to tell the Quantum
drive to turn off termination? If not, then it is on - that's the default.
You can plug and unplug termination packs on the cable all day and it won't
make a bit of difference to the Quantum.

could you please explain what you mean by all of this?
I have an STE and had a look inside. The W300/301 jumpers are open
(unused). Is this for selecting external or internal drive as the default
"A" or something?

>2) Connectors:
> 34 way connector on floppy drive (5.25 card edge - 3.5 pin header)

> So be careful plugging in the cables.

Is all of this "standard", or is it Atari specific?
What I'm trying to find out is what to look into to make my HD drive work
in HD mode in my STE which it doesn't for some strange reason.
Someone mentioned "intelligent mode" on disk drives.. is this something the
ST needs, while PCs don't use it?

> The terminating resistor pack on the floppy disk drive may have to be
>removed.

What's this? I've never found a termintor on a disk drive before.

>The floppy disk drive mechanism should have internal jumper positions
>to select the drive required. For drive A the Drive Select 0 jumper
>should be made, and for drive B the Drive Select 1 jumper should be

Done, and it works fine in DD mode.
But in HD mode it just won't recognize disks at all.

>The older 5.25 and 3.5 drive mechanisms were usually well marked for
>drive
>select, either small pin headers or a multipole small switch.
>The newer 3.5 drive mechanisms use a 0 ohm SMD resistor for drive
>selection.
>They are normally set to select drive 0, so tweezers and soldering iron
>are
>required!!!

My drive luckily had a jumper in place, so that was no problem, but I've
seen Teac drives with no jumpers at all, but the soldered option you
mention above :-(ugh!!!

> That's what I would like to test. I've never had any compatibility problems on
> 1.62. Now if 1.62 is incompatible with STFM hardwae that's another story...

Correct. Everyone seems to have forgotten that TOS versions 1.6 through
2.05 were *STe only*. The init code will initialize the STe's extended
hardware without checking if its actually running on an STe, which causes
it to crash and burn on an ST... TOS 2.06 checks if its on an ST or STe
and intitalizes accordingly...

933. Taylor UUCP won't dial; uux prob. - _please_ help!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-16 00:00:00 UTC
From: mbecroft@tos.ak.planet.gen.nz
Message-ID: <HCQVADUQUp@tos.ak.planet.gen.nz>
Source record: 17616
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I am currently attempting to use Taylor UUCP under MiNT to get my email, since I am finding UPoint (which I currently use) rather limiting.

I've got an excellent mail reader, Mutt, working fine, as well as an rmail that will deliver the mail locally, but I am havign trouble with Taylor UUCP itself.

Previously, I had Taylor UUCP working perfectly, dialling my ISP and receiving the mail. At this point, however, I had no mail reader so I didn't take it further. Now that I have a mail reader, however, I've found that Taylor UUCP will no longer dial the remote machine.

At the shell prompt, I type

uucico -S planet

(planet being the name of my ISP's machine) but instead of dialling (like it used to do) nothing happens. Uuxqt is executed immediately after I enter "uucico -S planet" but uuxqt exits about half a second after it is executed and no dialling takes place.

The strange thing is, I do not recall changing anything in the configuration since I had it working.

I also found that trying to run uux with the `-' option, in order to make it pass the standard input on to the remote task (rmail in this case), caused uux to crash. Luckily I (hope I) can avoid this by using a command like the following:

uux 'planet!rmail < localfile'

where localfile is a temporary file created by my custom sendmail, containing the message text.

Here are the Taylor UUCP configuration files that appear relevant:

--- /etc/uucp/config ---

```
# The UUCP name of this system
nodename tos

# The UUCP spool directory
spool /var/spool/uucp

# The UUCP public directory
pubdir /var/spool/uucppublic
```

```
# The UUCP log, statistics and debugging files
logfile /var/spool/uucp/Log
statfile /var/spool/uucp/Stats
debugfile /var/spool/uucp/Debug

# The maximum number of uuxqts

Seem my posts tonight in comp.sys.atari.st and alt.binaries.atari - I just did the same thing to my Falcon. Works wonderfully (and has much better "touch" than the Falcon's keyboard).

I suspect that when the STe was designed atari wished to keep the option
of no internal drives and two external drives, hence the motherboard
options.

> >2) Connectors:
[snip]
> Is all of this "standard", or is it Atari specific?

It is as standard as far as the SHUGART interface definition.
SHUGART ASSOCIATES was an american company which produced some of the
first 8 inch and 5.25 inch floppy drives, and hence other manufactures
used the same interface to sell the drives. When the 3.5 inch and 3 inch
drives were introduced the same interface signal definitions were used,
but the connector type was changed.

> What I'm trying to find out is what to look into to make my HD drive work

```

> ST needs, while PCs don't use it?

The "intelligent mode" is something I have not come across, all the
intelligence in on the motherboard interface chip WD1772. The floppy
interface is only control, status and raw data read/write signals.
These signal definitions havent changed since about 1980!!

I whould also be interested in the "intelligent mode" information.

>
> > The terminating resistor pack on the floppy disk drive may have to be
> >removed.
>
> What's this? I've never found a termintor on a disk drive before.
>
The older 8 inch and 5.25 drives could be daisy chained up to 4 devices,
and just like the SCSI drives, had resistor packs which had to be
removed on the drives in the middle of the chain. Some of the 3.5 inch
drives had them, the newer dives haven't.

> >The floppy disk drive mechanism should have internal jumper positions
> >to select the drive required. For drive A the Drive Select 0 jumper
> >should be made, and for drive B the Drive Select 1 jumper should be
> >made.
>
> Done, and it works fine in DD mode.
> But in HD mode it just won't recognize disks at all.

Some drive mechanisms use pin 2 to select the HD option ie the signal is
from the computer ----> to floppy. Other drives use pin 2 as the HD
floppy status ie the signal is from floppy ----> to STe this is the
"normal" type, the STe requires the status signal from the floppy.

If the HD drive is external then connect the pin 2 on the 14 pin din
floppy connector to pin 2 on the 34 way IDC motherboard, as the HD
selected status is not availiable on the 14 Pin connector.
STE internal jumpers W300 2-3 and W301 2-3 fitted.
Check switch 7 connected on the motherboard to enable HD formatting
option in the menue.

TeX is a text formatting program, used by many people (incl. myself)
instead of a word processor. As professionals from the printing business
(printing books etc.) developed this program, lots of professional
knowledge is incorporated, making it really easy to output
ready-for-printing documents. TeX source files is also the only form of
machine readable documents that publishers are willing to accept directly
as a file. Many books on computer related subjects have been written with
TeX, if you know it a little you can recognize them. TeX is however
disliked by many people because with the sort of computing power that is
available on Ataris no WYSIWYG is possible, and you have instead to deal
with formatting commands, which are somewhat tedious to learn.

Dunno Omen. If you're ready to spend a little money I'd much recommend
MagiC for multitasking. But you can try MiNT together with XaAES or
oAESis, which is all freeware, but you'll find it too slow on a 1040STE,
I guess.

Cheers Peter

Hi,

Is there a way to make a SC1224 color monitor to act as a TV set? It seems the monitor plug has a composite sync in wire.

Thanks

Adam

The program isn't (actually, programs aren't) that large, it's all
the fonts...

TeX is a very old typesetting language. It's main advantage is that
it does equations. If you plan to write techincal papers, TeX is
the ONLY way to fly. Otherwise, go with a DTP such as PageStream.

>make a bit of difference to the Quantum.
>
>
OK, I am not very familiar with this kind of stuff. Which utility/software
should I use? (once I had another quantum chained behind the 540 and this
worked fine!)
Let me explain the problem
I have a MegaST, a LINK II, a Quantum Ligthning 540 S and a ZIP drive. The
Quantum has two 50 pins sockets, one with the LINK II, the other had a
terminator pack and now a cable for the ZIP. I use CBHD 5.02.
This system simply keeps rebooting. Other drivers (like HDDRIVER 62. demo,
ICDBOOT 6.5.5) do not help.
However, I can boot from floppy (no matter waht driver). When I do this I can
format and partition the ZIP and copy files from the floppy to it.
The problem is with Quantum: something weird is returned when recognizing the
Quantum like QUANTUIM LIGTHNINGg54~Sng and things displayed in a window are
distorted (number of bytes, folder and filenames etc.) The result however is
always the same when rebooting from floppy. The partioning scheme is not
recognized (always 4 partitiones including ZIP, while I have 7 partitions on
the Quantum).

I 'll bee gratefull to anybody who can help me out!

I have a 4 meg MegaSTE with an HP Deskjet 600. I have Atari Works, as well as a lot of other software. My problem is that when I want to print to the HP, it doesn't act like it is online. IF I load Atari Works, and then print a blank page from within that program, it will then work with other software. I would like to know if you have any tips on how I can initialize it. A tiny program in GFA would be fine. Any ASCII codes I may need to be aware of? I'm open to suggestions at this point. Also, I am using the HP 500 driver. If there is a 600 driver, could you upload it my way?

Btw, I have been running the Kingdom BBS for Atari users since '90, and if you would like to give it a ring, the number is 817 246-7629. My handle is Pioneer.

Composite sync is not the same as composite video. In order to use the
SC1224 as a TV monitor, you need an RGB splitter - and in most cases, a
TV set is less costly.
```

Trun the printer on first, Marc. I think there are a couple of HP CPXes
(probably even here on STarship, 1:105/311 and 51:205/311) that will
allow you to set/reset various parameters - go to www.shareware.com and
set for atari files, then search for "printer" - that should bring up
lots of stuff.

>Btw, I have been running the Kingdom BBS for Atari users since '90,

zip drives use the centronics port (printer port) right.
They seem to be good value at present but the local dealers
hardly remember what an atari computer is.
Is there some software about that will make my STE or STFM
treat the zip drive like a normal hard disk?

You should use the SCSI version of the ZIP and an adaptator:
ST printer port is -mostly- unidirectional

I have a few programs (one is an accessory, ne is a normal program) which
will do the trick. You can get them at
http://apb25.emma.cam.ac.uk/hp/hp_a_progs.html

I have also emailed them to you as they are only about 4K.

If you mean the old 8-bit stuff, check out http://www.emulators.com/ - home of the guys who wrote PC XFormer, the 8-bit Atari emulator. As well as selling XFormer cables to do the thing you want, they have plans available to build your own cable.

Some of them don't even know what "VESA" or "PCI" mean. they're
salesmen, not real people.

>Is there some software about that will make my STE or STFM
>treat the zip drive like a normal hard disk?

Yes, if you get the SCSI version. You CAN NOT use the parallel port
version on anything but an IBM/clone (and in spite of what the
salesdroids would have you believe, it won't work on all of those,
either).

The SCSI version will connect to any of the available ST host adapters
and will act like any other hard drive. All host adapters (if purchased
new) come with the required software; I would highly recommend, however,
that you get HD Driver (by Uwe Siemet) as it is easily the fastest, most
reliable, and best-supported hard disk software available for the ST
series.

959. Bad STiK behaviour

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-18 00:00:00 UTC
From: trax@collegeleboeuf.qc.ca
Message-ID: <5gn1gefub2@wagner.spc.videotron.ca>
Source record: 17642

Has anyone ever gotten a message like this from their ISP after using STiK?
I seem to get it about every 10th time I connect to my server:

"This is to let you know that at the time this email was sent to you,
you were using the SLIP server with an incorrect IP address of 204.19.108.2
instead of the 204.19.108.63 IP address that was issued to you when the SLIP
server started.

The SLIP server did try to prevent this problem from disrupting your SLIP
connectivity but note that while it's doing that, you can still run into
Internet roadblocks. A prime example of that is that no FTP transfers
will work while you don't have the proper IP address entered.

You can make sure that you are using the right IP address in different ways,
probably the easiest is just to look at the display you get after logging
in and note down the IP address and enter it in your TCP/IP (or winsock)"

bla-bla-bla...

..which I can't do anyway, since STiK 1.12 doesn't seem to display the
IP address when you ask it to.

Anybody?

It's been my experience that Maxtor SCSI II hard drives don't like any Atari host adapters that I have tried including Link, Link II and Mega STe internal. Quantums always seem to work OK.

Yes, I know a bit about this. If I'm not totally mistaken the signals
should be as I made my previous (now broken Sony MPF 520-1/LM-F2) output on
pin 2:

The logic signals out from pin 2 should be as follows:

"high" [around +5V] when;
a) drive is not accessed (no read/write/format actions)
b) drive is accessed with a DD (720KB) disk inside the drive

"low" [around 0V] when;
a) drive is accessed with no disk inside the drive
b) drive is accessed with an HD (1.44MB) disk inside the drive
---

And from a correspondance I had regarding all of this a while ago:

I'm quoting from "Scheibenkleister", the Atarians "bible" for every

aspect of mass storage systems.
All uneven numbered pins carry mass (0V). All signals are low active.
In or out is defined as seen by the drive.
1 The exception: MIGHT carry Disk Change Reset In
2 Disk change Out
Head Load In
Density In/Out; Active High/Low
In Use In
4 In Use In
Head Load In
Disk Change Out
6 Drive Select 3 In
Ready Out
8 Index Pulse Out
10 Drive Select 0 In
12 Drive Select 1 In
14 Drive Select 2 In
16 Motor On In
18 Direction In
20 Step In
22 Write Data In
24 Write Gate In
26 Track 0 Out
28 Write Protect Out
30 Read Data Out
32 Side Select In
34 Ready Out
In Use In
Disk Change Out

I really don't know much about it, and I don't think the person telling me
about it did either, other than that it was an option with certain Teac 235
drives (the 3xxx and 4xxx series I believe), and that setting it to this
mode made it work.

From my notes about the subject I can also quote something else another
person said about using HD disk drives:

The type of HD drive you select will depend upon you but some
are easier to work with than others - it is essential that you get a drive that
will handle the full Shugart specs and not one of the (increasingly common) PC
type HD drives that has limited functions. The HD drive MUST have the ability
to send out the HD select signal on it's interface connector. The PC does not
use this normally as the HD select is controlled by the PC host card and tells
the drive what kind of disk is inserted (this is the reason that the PC can
mess up a HD disk by formatting the media with the wrong data rate).

For full compatibility you'll need to gate the HD select signal with the drive
select lines so that you can mix both high density and normal density drives
on the same bus.

This person seems to talk about the pin 2 signal, but it occured to me that
the problem I have might be related to the disk drive not fully conforming
to the Shugart standard, thus not behaving like it should with the ST.
Obviously PCs act differently (one difference is the way it detects when a
disk has been changed, and to make it work on the ST the disk detect
microswitch has to be shorted or else the ST won't recognize when a new
disk has been inserted and thinks the same one is in there all the time!!).

I guess my drives haven't got them then. They probably look like those
terminator resistor packs which are used in hard disk units: one pack with
10 resistors (looks like a small comb), right?
If that's the case there's nothing like it in my drive.

Or... you have to switch 8/16MHz manually. This is the least of the
problems. To be sure about everything in this phase I've been hardwiring

8/16 MHz by a switch just to eliminate any more complication of problems,
to be sure that I'm actually feeding the AJAX 8 or 16 MHz.

>If the HD drive is external then connect the pin 2 on the 14 pin din

>STE internal jumpers W300 2-3 and W301 2-3 fitted.
>Check switch 7 connected on the motherboard to enable HD formatting
>option in the menue.

Yes, I've done that (only works with TOS 2.06 I believe), but it shouldn't
affect the computer being able to read HD floppies. As far as I know it
only enables a software option in TOS where you get an additional "HD
format" in addition to SS and DD in the "format disk" menu.

As for the W300/301 jumpers.... nobody has ever mentioned that I should
touch this- are you sure? I'll check to see how they're configured now, but
from the top of the main circuit board there are no jumpers there at all.
Perhaps they're wired from the solder-side. I'll check.

But I doubt this has anything to do with my problem. I've heard of many
other people installing HD disk drives in their STs (regardless of TOS
version, ST/STE etc.) and they've made it work. But the differences have
been the drives they've been using. They've all had older drives with the
options made available with jumpers- jumpers which unfortunately aren't
available on newer drives... So somehow I have to figure out what I'm
missing.

>chip... and the TOS (2.0 or higher)

Yes, I do have an AJAX chip installed, and I use TOS 2.06
-but you don't have to use TOS 2.x and up to be able to use HD
disk drives as far as I know. It's just that TOS 2.x is made with HD drives
in mind adjusting the step rate for it.
In that respect there are several AUTO programs which sets the step rate.

Anyway, this isn't the problem- it's the drive itself.

d> Could someone look in their manual and tell me what the settings are
d> for the set of 8 DIP switches inside the hard drive bay? Thanks.

Some info was posted in here a couple of months ago:

=====
FROM: dipching@ping.be (Vandeweghe Jo)
Organization: EUnet Belgium, Leuven, Belgium

In response to the old question somebody asked a little time ago about Dip
switches in the Mega STE (Also TT referenced):

* Dip 1 is intended for a faster CPU speed e.g. CaTTamaran 48mHz installed.
* Dip 7 is only for a high density installed unit; then the format dialog
in TOS will give the HD option.
* Dip 8 is for a machine with DMA Sound Off.

That's all I know about; to go further you may read ST-Computer 9/91 page 100
(German magazine).

I hope it will answer to this endless enigma (ELP ...)

While true, Michael Ruge described a relatively simple method of adapting it
so that two hard disks can be used -if the room can be found nd the power
supply is strong enough, of course...

And the FPU was improved to an MC68882.

l> (otherwise it would run a lot faster, or if they had put in a second
l> level cache)

That appears to be correct as far as I can determine.

The confusion might be because the data and address buses were both 32-bit
wide (unlike the Falcon), but still driven at 16MHz.

I'm not sure what you mean by a second-level cache, but certainly the
256-byte processor cache doesn't seem to be very big - I don't know how much
better it would perform if it were bigger...

To get the status of these switches, one searches the cookie jar for the
_SWI cookie. The low byte of the value portion of the cookie (the byte at
offset 7 from the address of the _SWI cookie) gives the status.

When a bit is "off" (ie zero) the switch is "on".

A question: is there a way to verify the value in this cookie? Once my
code has determined "this machine has dip switches", how can I read the
correct value of those switches? What hardware address does one peek at
to get the info? (I don't recall anyone down this part of the globe
getting ST Computer mag)

For example, a rogue piece of software can plonk a random value in the
_SWI cookie, which could lead to undesired results later on when software
that relies on the cookie being correct does something that may be illegal
or illogical given the correct status of the switches/hardware.

From my point of view it's a hardware problem you have. If data are
corrupted when they are transferred in most cases this is caused by
wrong termination or bad cable connections. Try to use other and/or
shorter cables.
I once had a bad cable connected to my ST which caused the system to
reboot permanently.

Any driver will do because all drivers treat a ZIP like a hard disk with
removable media. Note, however, that you need a SCSI ZIP for your Atari.
The parallel version won't do. There is definitely no way to connect it
to the Atari.

If the Maxtor is recognized by the driver software it is unlikely that
the host adapter doesn't work. If it didn't work the driver wouldn't
recognize anything at all.
I think David should check other hard disk software, e. g. CBHD, HuSHI,
HDDRIVER.

Your provider must be running on a Posix system like mine, because I get
that message (verbatim) at times when running under STiK. It occurs less
frequently (rarely) now that I'm running v1.12. Dunno why it shows up,
though. When I summon STiK to display the IP address, it always does.
Somehow there's a form of mis-communication between the client (STiK)
and server, but it's never interferred with my connection.

I have 4x1mb 30 pin simms which I intend to install in my STE. The speed rating is 80 nanoseconds.

Is this O.K. for the STE. Does the wrong speed cause conflicts with the motherboard, or is it a case of the faster the memory the better?

Thanks in advance. (replies by email or newsgroup-either is fine)

Hi Tim,

From what I had been told 80ns should be ok. If you go faster than that
you might run into timing issues but that is only what I have heard(from
a person that has worked with Atari's since 1981). I am planning on
doing the same upgrade to my STE and that is why I had asked him. He
told me anything in the 80-120ns range will work fine.

Hope this helps,
Christopher

976. SIMMs for 1040ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-19 00:00:00 UTC
From: jerabek@mx5217.gud.siemens.co.at
Message-ID: <5gp1uq$4vc@zwei.siemens.at>
Source record: 17560

Hi!

I hope that's not a FAQ but I want to expand the RAM on my old 1040STFM (it currently has 1 MB). It would be easy with the good old DRAMs in DIL-packages (old ones out, solder in new 1MBx4 chips, voila[1]) but DRAMs in DIL-packages seem to be extinct, at least in my part of the world.

Since I have some old SIMMs lying around I'm interested in an adapter which allows the use of SIMMs in the old Atari STs. Does such a thing exist and if yes, does someone still sell it? Or are there schematics somewhere which I could use to build one myself (or have one built for me, to be more exact)?

TIA, Jerry

[1] Yes, an additional wire from the MMU to the DRAMs is required.

Those should be fine-you just wouldn't want to go any faster-it would be
wasted. You also would not want to go any slower than 120ns, AFAIK...Make
sure that all 4 SIMMs are the same type/rating and you shouldn't have any
problems... You'll love the extra space! :)

978. Upgrading STE Questions

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-19 00:00:00 UTC
From: Tim Pattison <tim@ravenhouse.demon.co.uk>
Message-ID: <I6RF5BAPXBMzEwj6@ravenhouse.demon.co.uk>
Source record: 17562
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I've got an STE (upgraded to 4mb ram) which I haven't used seriously for some time and I want to start using it again for music sequencing. It's great as it is but here's what bugs me :

I've got loads of kit from old 386/486 PC's (including SCSI hard drives, SVGA monitors, internal power supplies etc) lying around doing nothing!

I'm sure other people must have asked about this but I'm new to this newsgroup and I just want to know if I can use any of it!

I don't want to go too deeply into the subject right now but has anyone tried this?

Are suitable controller circuit boards available for SCSi hard drives and SVGA monitors that would enable them to be used with the STE?

If I could build my internal SCSI hard drives into an external hard drive for the STE that would be great. If I could build the STE and hard drives and power supplies into a tower case and use a SVGA monitor, that would be even better! (It would also clear some space in my increasingly untidy office).

Then of course there is the question of external keyboards.

The list goes on... and on...

I'm not looking for complex technical replies at this stage, I just want to know if it is an idea worth pursuing. Any advice would be much appreciated.

Replies by email or newsgroup (either is fine)

Is the problem reading .PDF files, or files in general with Ghostcript?
Do .PS files work?
I haven't been using it for a long time, but I can't remember doing
anything special in order to read .PDF files. I think I read them just like
.PS files.

But... I did have some *big* problems installing GS!!
After a lot of fiddling around, help from others, experimentation etc. I
finally made it work. Now the only thing which doesn't work is "help"
within the program, but somehow I either got GS to work with help, but not
with the other files, or the other way round. I naturally chose the latter.

I believe I messed around with the setup files for it to work...
The problem was he environment. This is a part from the "stgs.rc" file
which has to do with that:

Ghostscript Environment Variables.

setenv
GS_LIB=.,D:/utility/viewers/gs/ps,D:/utility/viewers/gs/fonts,D:/utility/viewers/gs/help

Naturally you have to set it to the path of your harddisk setup. The funny
thing is that you have to set the path in UNIX style (/) unlike the usual
TOS/MSDOS style (\).
I also have an environment program in my AUTO folder where I've set several
variables (tmpdir, clipboard etc.). Can't remember if GS referred to any of
this, but if you can't get it to work with the above line you might try to
additionally use an environment setter like the one I'm using.
You can find the same program at my FTP site:

ftp://ftp.sn.no/user/hallvart/atari/envir.zip (3 Kbytes)

And this is what my environment setup file for that program looks like:

TMP=C:\tmp
CLIPBRD=C:\clipbrd
LOGNAME=hallvart

```
HOSTNAME=sn.no
SHELL=D:\utility\unix\gemini\gemini.app
EDITOR=D:\editors\everest\everest.prg
AVSERVER=C:\thing\
FONTSELECT=C:\thing\
THINGDIR=C:\thing\
```

You only need to bother with the first 2 lines though (if it's needed at all).
Good luck!

Wasn't there also one called X-Debug by the ex-HiSoft programmer Andy
Pennell? ISTR it was marketed by the FaST Club for a very reasonable sum. It
got a good review from Mark Baines in (I think) ST Review whe it came out.

It's not in FaST Club's most recent adverts (I had one through this week),
but it may still be available. Try them on stclub@cix.compulink.co.uk

Due to atari's cost cutting, the printer port is driven off the sound chip
(at least in normal STs). For some strange reason, this means that you have
to switch the printer on before the computer or it won't work. Fortunately
there are some programs which can "reset" the port and so allow you to use
the printer. i.e.
switch ST on
create document
(optional) curse loudly
switch on printer
run "reset port" program
print happily everafter

988. MIDI sequencer

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-19 00:00:00 UTC
From: Rolf Nilsson / RONI MUSIC <roni@mbox317.swipnet.se>
Message-ID: <3330527B.62F5@mbox317.swipnet.se>
Source record: 17572

Affordable sequencing

It's amazing the things you come across at times Little treasures just lurking out there to be found....

I first read about Sweet 16 on the internet, in the comp.sys.atari.st. newsgroup. Big deal, another ad. Demos available. OK, I'll give it a try. Well, I'm impressed! I found a good MIDI sequencer at a reasonable cost.

Sweet 16 will work in any resolution on any Atari ST, TT or Falcon. This is great because not everyone has a mono monitor. I tested it out on my Mega STE with a mono screen. There are two versions for testing. A DEMO and a LITE version. The LITE does not have all the functions that the DEMO has but it does allow saving song files. (But not MIDI files) The DEMO does not allow saving at all but does have all the functions anbled. I will review the DEMO.

NOTE: Sweet 16 does not have any score editing or printing features. I emailed RONI music and they said that this is not in the pipeline because this would add greatly to the cost and not that many people wanted it. (I'm not so sure about that. It would be a nice option.)

Sweet 16 DEMO is a 16 track MIDI sequencer. It is very similar to Notator. It has a 'Pattern 'mode and a 'Song' mode to compose with. In 'Pattern' mode you can make up different patterns and link them up to make a song. eg. Intro, verse, chorus, verse, chorus, end. Song mode is continous recording of each track.

The main page has plenty of information and features. It shows the 16 tracks and shows all the usual features like naming tracks, transposing, muting, soloing, MIDI activity etc. etc. It is quite comprehensive and easy to use. (In other words I didn't have to read the manual:-) Hit the mixer button and there is a really good 16 track mixer that allows easy mixing of your file. It reatures volume, pan, reverb, chorus, solo, muting, snapshots, quantising, program change, and all this in real time.

Hit the EDIT button on the main page and you can choose between a Piano Roll editor or an Event Editor. Here's where you can manipulate data to your hearts content. (I won't go into detail:-) There's heaps more! All MIDI functions and filters etc. Remixing and mixdown of tracks... too amny things to cover here. Get the DEMO and find out for yourself.

The cost is USD 49.95. This includes a 50 page manual.

SUMMARY

If you need a very inexpensive sequencer and you don't need scoring,
then Sweet 16 is well worth getting. It is also available for the PC.
This means that there will be ongoing support and development. That's
very important in the Atari world!

Check out RONI Music on the internet.

989. Mega ST Keyboard

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-19 00:00:00 UTC
From: Mark Burmeister <pearl@deskmedia.com>
Message-ID: <33307255.57B3@deskmedia.com>
Source record: 17573

I found a used keyboard for my Mega ST but have not been able to get it to work. The keyboard came without a cable, and I have tried an R11 and R12 (I believe that's right, 4 and 6 conductor phone cords) cable without success, although the computer does stop its no-keyboard beeping. The power light on the keyboard also does not light, key punches aren't recognized, and the mouse is not recognized. I would appreciate any information on finding/making a workable cable or finding out if the problem is elsewhere.

Glad to be of help. I know that there are problems with a lot of
file-formats on the net, and for us Atarians we often encounter problems
with .zoo, .lzh and .tos files...
That's why I've chosen to use .zip *only* for all files I upload to my FTP
site. I wish everybody else could do the same. It would cause a lot less
problems and hassle for everybody.

Now, if only STzip could be upgraded to have the same functionality as
Lharc 3.10!!! (personally I've started using "Two in One" for all my
decompression, where the different file formats are assigned to it in the
"Thing" desktop).

I am farily sure that I have managed it. The paths on GS are a bit messed up. IIRC it presumed you were using F drive. Is GS 4 available yet? (much nicer fonts apparently)

Alternatively, try xpdf under Xwindows if you can. It is a nice program and just a _little_ smaller than Adobe Acrobat :-)

Go to one of the search engines and do a search on "atari AND SIMM" and
you should find at least one DIY archive - I probably have one around
here someplace, and there may be one at my ftp site (I haven't copied
the whole archive down to my Falcon yet, so I'm not sure). It's not
difficult, just tedious.

Dear ATARI users,

I got a ATARI SM194 Monitor incl. expansion card installed in an ATARI MEGA ST4. But I didn't get the startup-software for this monitor. Is there anyone who can help me? Is the software available on disc from anyone?

ThanX for your help!

The ST isn't 8 bit either. He was referring to the "old" Atari 800
(XE/XM/whatever) series of 8 bit computers.
But you are right, the ST isn't old. 12 years is nothing compared to the
time UNIX (not actually a system but an OS) has been around. And what to
think about PC's... They've been around for 17 years.

>I've got loads of kit from old 386/486 PC's (including SCSI hard drives,
>SVGA monitors, internal power supplies etc) lying around doing nothing!

You may be in luck. Read on.

>Are suitable controller circuit boards available for SCSi hard drives
>and SVGA monitors that would enable them to be used with the STE?

SCSI is the only way any sane hacker would go. Get the Link96 (read
back a couple of days here for the thread about SCSI hard drives) for
best results, and order it with HDdriver.

IF and ONLY if the SVGA monitor can sync to 15.75 kHz horizontal, you
can use it for color rezzes - 31.5 kHz (the standard VGA sweep rate) is
fine for ST High Rez, though. See
ftp://ftp.teleport.com/users/atari/multsynq.faq for the wiring details,
and some makes/models that are known to work for all resolutions.

>If I could build my internal SCSI hard drives into an external hard
>drive for the STE that would be great. If I could build the STE and hard
>drives and power supplies into a tower case and use a SVGA monitor, that
>would be even better! (It would also clear some space in my increasingly
>untidy office).

Tower cases are also pretty easy - there's an outfit in the UK that
makes a kit with everything you need, I think, or you can roll your won
as long as you can find a case that will accomodate the STe motehrboard
- which is very large, as such things go. My tower came from Lightspeed
Systems in Houston, Texas, USA. It has housed a Mega STe, and now is
the home of Boris, my TT030 network server.

>Then of course there is the question of external keyboards.

Several choices. Mine was easy - I has a spare MSTe keyboard, so I
wired a plug into the Falcon (same plug as the STe) and now have anice
external keyboard. You could get the Keyboard Gizmo, or the DEKA
keyboard adapter to use a PC keyboard, but since I already had this one,
and the jack cost me less than US$4 - well, why spend more?

>I'm not looking for complex technical replies at this stage, I just want
>to know if it is an idea worth pursuing. Any advice would be much
>appreciated.

Well worth the effort - for one thing, you can get all sorts of drives in a tower, once you have a good SCSI host adapter. I have two 4 gig hard drives and 4 CD-ROMs in the server tower. Had two floppy drives in there, too, but took one out to build a <Hack! Cough!> PC for my stepdaughter.

If you run into any problems figuring things out, just ask.

Hr.Martin Jerabek (jerabek@mx5217.gud.siemens.co.at) wrote:
[Question about SIMMs for ST deleted]
Looks like I'm answering my own questions :-) just in case someone else
is interested:

The German company woller & link gbr offers various Atari HW & SW,
including a RAM-expansion board for PS/2-SIMMs which makes it possible
to have up to 15 MB RAM [1] in an ordinary ST. It requires TOS 2.06 which
they also sell. Their web address is

http://www.inx.de/w+l/ (<- that's the letter L, not the digit "one")

Of course, I have no affiliation to them, I'm just happy that someone
still offers stuff for Ataris.

Does someone have experiences with this expansion board or with the SCSI
adapter (LINK96) they sell?

Hope this helps others,
Jerry

[1] So they say. But doesn't TOS 2.06 start at E00000 and thus limits
RAM to 14 MB? Doesn't matter much, of course. ;-)

>finally made it work. Now the only thing which doesn't work is "help"
>within the program, but somehow I either got GS to work with help, but not
>with the other files, or the other way round. I naturally chose the latter.

Interesting. Having a "drive F:", solved all my installation problems.
I've had GS up and running. The only snag was some fonts that had to be
assigned properly in the FONTMAP file. Other than that, it displays/prints
PS files very well, although slowly.

But when you "OPEN" a file, from the menu, there is no PDF option. I've tried
loading one anyway and GS refuses to do anything with it other than to give
me 4 error messages that I have to "pop" out of. I've tried loading the
PDF_2PS file, and other variations such as running the program from a CLI and
using the command "pdf2ps input.pdf output.ps" (where "input" is the name
of the .PDF file and "output" is a new name). Same deal: error,
error,error...

This is what I mean when I say I've tried. Any suggestions?

I've tried contacting Tim Gallivan regarding this, but alas his Atari is
dead but his MAC is doing very well...I haven't heard from him regarding
this PDF business, though I have emailed...He's the man who compiled Atari
GS from unix source. I don't think we'll be seeing any new versions of
Atari GS :(

Later...

Better to get a full 9-pin null-modem cable; there's no handshaking possible
with a 3-wire cable. Alos, in my experience, you must restart in DOS mode
on the PC if you are running Win95, else PCSLAVE.EXE fails to properly init
the serial port.

If all else fails, go to my ftp site and get
ftp://ftp.teleport.com/users/atari/pc_st.zip so you can use sneakernet (if
you have a bunch of disk formatted w/o the M$-DOS idiot bytes).

I'm considering doing this myself as well. I did a measurement of the
motherboard, and find that the case will need to handle something around
18 inches by 11 inches. Don't forget making your own cables for the power
supply. I'm doing this sometime. A good full-size tower case shouldn't
cost more than $75, unless you want those funky ones that will hold two
motherboards inside. Those will set you back a few hundred.

: Several choices. Mine was easy - I has a spare MSTe keyboard, so I
: wired a plug into the Falcon (same plug as the STe) and now have anice
: external keyboard. You could get the Keyboard Gizmo, or the DEKA
: keyboard adapter to use a PC keyboard, but since I already had this one,
: and the jack cost me less than US$4 - well, why spend more?

I have the AT-Key, which I purchased used from when someone was selling
one awhile ago. I merely had to resolder the wires to get better contact
as they were coming off, and take off the original connector, and rewire
it to another one, that has 6 connections. Right now, it's coming out of
the case through the numeric keypad cutout. However, to each their own.

Heck, it's worth it taking the time to do it yourself if you do it right.
Lots cheaper too, though it'll take more time. I don't mind. I just
replaced a power connector on my TTY not long ago, when the wiring leading
to it broke, making intermittent connections.

But of course, we could turn this thread into an ObAtariHack thread,
making it look somewhat like the alt.hackers newsgroup, which often has
some very interesting ObHacks, both hardware and software.

I am enquiring on behalf of a friend who owns an atari STFM and would like to add a hard drive to it.

I am not an ST owner myself so am totally unfamiliar with Atari hardware but extremely familiar with PC hardware and software.

Any information anyone may have about the drive types which should be used, the interface on the back of the unit, cabling etc would be gratefully received. Alternatively the location of a FAQ for atari newsgroups would also be very helpful.

If possible please email me direct rather than respond to this newsgroup althoug I will check in for a while.

Many thanks in anticipation of your assistance.

Hey Eric...

Good to hear from you again, and I really hate to inform you of this, but the ST is not an 8-bit machine!

I have, however, gotton that ol' 800 working well with the disks and everything... so I'm looking to move some basic-type stuff onto the floppies for that as well.

My question is this: Does an ST have an SIO interface to hook up 8-bit peripherals? I'm getting an (Not old - middleaged) 1040ST in May.

I don't see why. XaAES and oAESis seem to be reasonably quick from the little I have tried them. AES 4 _is_ slow, however - I don't recommend that. The real problem with XaAES and oAESis is not the speed (they seem to be quick enough) but the fac that neither of them are complete.

Nothing has appeared on the XaAES mailing list for a while - has development stopped?

Yeah, that is strange indeed. I contacted Tim Gallivan (the guy in charge
of GS for the ST) and he told me to install it on drive F. Well, it still
wouldn't work even though it "should"....
Theory and practice is pretty different at times.

>But when you "OPEN" a file, from the menu, there is no PDF option. I've tried
>loading one anyway and GS refuses to do anything with it other than to give
[...]

>This is what I mean when I say I've tried. Any suggestions?

You might try what I suggested in my last posting ;-)
I just tried GS a minute ago to check, and I had no problems whatsoever
loading a .PDF file.
I selected "open file" (or whatever), got the file-selector, clicked on the
.PDF file I wanted, and GS started loading it together with fonts etc.

>I've tried contacting Tim Gallivan regarding this, but alas his Atari is
>dead but his MAC is doing very well...I haven't heard from him regarding
>this PDF business, though I have emailed...He's the man who compiled Atari
>GS from unix source. I don't think we'll be seeing any new versions of
>Atari GS :(

Well, the current version works fine. Just try what I suggested in my
previous message. The strange thing about it is that GS somehow mixes UNIX
and MSDOS/TOS styled delimiters "/" and "\"... this is clearly seen when GS
loads fonts as it displays the paths...

Again, here's the line from the "stgs.rc" file which apparently does the
trick:

Ghostscript Environment Variables.

setenv
GS_LIB=.,D:/utility/viewers/gs/ps,D:/utility/viewers/gs/fonts,D:/utility/viewers/gs/help

(edit appropriately to the path where you have GS installed)

Run down to Radio Shack and pick up a package of 6-conductor RJ-11 type
plugs and a crimping tool. Cut off one end of the 6-conductor phone cord
that you have tried, note which way the wires are attached to the plug
you just cut off, and crimp a new plug on with the wires in the opposite
order (e.g., if green was on the left on the old plug, flip the wire
over so it's on the right on the new plug). I've made a half-dozen
coreds this way and it works every time.

>needs some help. Please respond with any ideas. Thanks. Frank.

The manual isn't really worth much - it tells you to turn on the computer, mainly. However, assuming you decide you just HAVE to use the keyboard instead of the mouse, the mouse pointer can be moved with Alt-cursor keys, and Alt-Insert is the same as a left click, Alt-Clr Home is the same as a righ click; Alt-Help will do a graphics screen dump to the printer port (in Epson format, I think - there are programs to make the dump come out as HP DJ/LJ format though) and Alt-Undo is supposed to stop that, but rarely does unless the printer is actually connected.

Disks on the ST must be 720k 3.5-inch; you may be able to find some in local pawn shops or electronics surplus stores. Disk format is compatible with MS-DOS so you can swap files back and forth easily with a PC (although of course PC programs won't run on the ST and vice-versa). Format the disks on the PC - there are a couple of bytes it needs to see that the ST doesn't write during a format.

All of the ST's ports are clearly marked with icons so it should be no problem to figure out where to plug in the RF cable to hook to the TV antenna inputs, the modem, the printer, and so on. The monitor type is sort of proprietary; look for an Atari brand monitor, model numbers starting with SC for color and SM for monochrome- you may be able to pick one up at Goodwill or a pawn shop cheaply. It's possible to hook up some multisync SVGA monitors but that's more complex. Most Amiga monitors will owrk, with an adapter plug to fit the monitor port on the ST, but Amiga stuff is pricey.

There is 1 meg of RAM and 192k of ROM in a plain-jane 1040ST - the OS (known as "TOS" overall, and including "GEM") is in the ROMs, so 1 meg of RAM is adequate for most purposes. It's possible to upgrade the RAM to 4 megs, using an aftermarket add-on RAM board, but at this juncture I'd say don't bother unless it starts getting difficult to fit whatever apps your Dad wants to run.

Anything else you want to know, either ask here in the newsgroups, look at my Web site (see below) and you'll find links to lots of other info, or email me. Mostly if you ask me directly, I'll end up referringyou back to the Web site becasue that's where I put what I know - but if it's not there, I'll go hunting.

1018. FS: Atari Computer Goods! Some Shown! FREE Catalogs!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-21 00:00:00 UTC
From: bensmith@linda.teleport.com
Message-ID: <5gtstn$i24$1@linda.teleport.com>
Source record: 17595
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech,abg.atari

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks, Labtec Speakers & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: 1040STF Computers, Spectre GCR Macintosh Emulators, MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Hard Drives, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I

will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

Hi Tim, on 19 Mar 97 you wrote: ...respect, brethren

t>
t> I have 4x1mb 30 pin simms which I intend to install in my STE. The
t> speed rating is 80 nanoseconds.
t>
t> Is this O.K. for the STE. Does the wrong speed cause conflicts with the
t> motherboard, or is it a case of the faster the memory the better?

The ST can only access RAM at 150ns if you use 256Kb SIMMs (ie 512k or 1Mb
machine) or 120ns if you use 1Mb SIMMs (2Mb or 4Mb machine). Faster access
SIMMs than that make no difference at all to performance.

t> I've got loads of kit from old 386/486 PC's (including SCSI hard
t> drives, SVGA monitors, internal power supplies etc) lying around doing
t> nothing! I'm sure other people must have asked about this but I'm new
t> to this newsgroup and I just want to know if I can use any of it!

Certainly a SCSI HD and power supply would be integral to the building of a
Tower - quite a good idea too. The only addition you'll need, apart from the
appropriate leads, is the host adaptor - a Link for between 50 and 70ukp tops.

To use an SVGA monitor you'd need some form of graphics card (unless you
wanted to twiddle a bitmore and just use it as a mono monitor). Graphics
cards are a bit pricey and introduce some compatibility issues that you'll
need to be aware of...

t> Then of course there is the question of external keyboards.
t>
t> The list goes on... and on...

Not too difficult, yes.

t> I'm not looking for complex technical replies at this stage, I just
t> want to know if it is an idea worth pursuing. Any advice would be much
t> appreciated.

Hopefully the above was ok for you. System Solutions would be a good
one-stop shop to supply the necessary add-ons and discuss the issues that
would arise.

No, but there was a custom cable designed for use with Darek Mihocka's
8-bit emulator on the ST. I can't remember Darek's e-mail address, but
his company (which markets 8-bit and ST emulators for the Windoze) is
called Branch Always Software (BRA-Soft) and is on the web... perhaps he
still sells these cables?

You seem to never have tried to compare it with MagiC. You might feel it is comfortable speed, but you won't anymore after you've seen MagiC working. I agree the speed difference between MultiTOS AES and XaAES or oAESis is vast, and there is not much difference between XaAES and MagiC AES anymore, but MagiC then scores by having a greatly faster kernel, especially if you do not use a Minix filesystem.

No help but having similar problems with ZIP, Quantum Maverick 270s,
ICD link11 and ICD drivers, STFM 4meg. Both drives work separately but
not together. Quantum boot partition is partly trashed on booting up:
quantum is last in the SCSI chain. Did get to boot properly once after
changing ZIP id from 6 to 5, but could not write to quantum without
errors and finally the boot partition crashed.

Next stage is remove internal termination from quantum and have ZIP
last in chain.

Have you got your ZIP to work yet?

Regards Lewis

Norbert W. is working on it - it should be just about ready to release.
It is my intention to pick up at least 4 of these boards; they connect
via the ACSI or SCSI port and link to a 10 Mbps thin Ethernet cable, and
Norbert is providing NetBEUI drivers - which means my wife's Win95 box
can be in the network, too.

Hello,

I'm wondering if it is possible to read my midi files on a Atari ST machine. I use Windows NT/Win95 and Cakewalk for Windows to create my music. I can export to .mid format, and want to put these files onto a diskette and read it on my friend's Atari ST (Cubase).

I know that I have to use a 720 KB formatted DD diskette, but is that all?

Thanks in advance,

Michael.

No, I am chasing a syquest 135 cable. According to some messages this must
work. When it works I'll let the whole world know....

Dear Atarians,

I have tinkered with writing fast blit routines for the Atari ST. But, I have yet still not programmed the STe Blitter chip down to the bare metal. I want to. I have a STe, so I'm fine there. What I need are docs on how to do such a thing. If anyone could offer some advice, I would appreciate it. Thanks.

He was hired by Microsoft right out of college years ago, and he was
still working for them when I met him about 18 months ago. So he's
probably still there.

Out of the ether, the following was mentioned by Steve...:

HS>> * Dip 1 is intended for a faster CPU speed e.g. CaTTamaran
HS>> 48mHz installed.
SS> Strange, ive never had this switch set in any of the moded
SS> machines ive had.
Thats because your PAK still runs the bus at the normal speeds (i.e. not accelerated). Its only the cpu and onboard logic which run faster, but as far as the normal Atari stuff is concerned (i.e. MMU, DMA, etc) your running an unmoded machine.

HS>> That's all I know about; to go further you may read ST-Computer
SS> 9/91 page
HS>> 100 (German magazine).
SS> OK, send it here, i'l OCR and Ruftrade it. 8~))
Harry's not started reading ST-Computer has he??? :-)

Here is the final and complete list of atari bits and pieces to go to good homes. Sensible offers considered on everything.....

£ - UK pounds and includes postage & packing within UK. Elsewhere a little bit more to cover the stamps!

Fontkit plus 3 : £15
Script wordprocessor (MacWrite clone - uses signum fonts) : £25
Calligrapher Gold version : £35
Twilight screen saver package : £15
EasyDraw 2 plus HP laserjet 2 driver pack : £15
Imagecopy 4 with manuals : £20
Fonty (Calamus font editor) with manual : £15
Textstyle (produces bitmaps from vector fonts!) : £12
Vector X-change (converting between vector formats) : £12
X-boot (ultimate bootup prog) : £20
HDDriver (latest version) : £15
Extendos Pro 2.3 (CD rom drivers): £10
Selectric (registered) : £8
Outside 3.2 VMM (68030 only) : £25
Addrese (address gem prog - very nice) - registered : £8
2-in-1 (manages all compression utils in a shell) : £8
Gemspool (printer spooler) - registered : £8
NVDI3 100-font pack (TTF high quality typefaces on 5 disks) : £15
Everest editor (registered) : £8
Gemview (registered) : £10
breakthru 2 plus (32 channel midi sequencer) : £50 with adaptor

CD's
Bingo (german PD/shareware etc) : £10
Wow (similar) : £10
Gemini archive of michigan : £15
Suzy B's double CD treasure archives! : £20

Hardware etc
Vidi 12 ST colour digitiser for ataris : £30
SCSI external CD rom driver (apple mac - needs a scsi connection) : £75 + postage (its heavy!)

Hama trilock digital genlock unit (suitable for any computer inc. pc's etc.), new (cost £350) - only £230

Titan graffiti STE genlock unit - £100 with PSU

If interested in anything, send an email to spesgw@cf.ac.uk.

Regards,
Simon

Hi,

I wonder if someone can help me??

I have just tried to use my Atari 520 STFM and the disk drive just keeps spinning and the GEM Desktop comes up without any drives to click on etc.

Everything else is okay. Is my Diskdrive to blame or is the controller.

I would be really grateful if someone could help.

Cheers

Ant.

1049. NOS and INN 1.5 news server

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-24 00:00:00 UTC
From: bkozlowski@nordnet.fr
Message-ID: <859217962_OASIS_@nordnet.fr>
Source record: 17532
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,comp.sys.atari.programmer

[followups in tech group only]
[posted also to NOS mailing list]
[no crosspost to demon.ip.support.atari, they are not concerned]

Hello all!

Many news servers update their software to INN 1.5 or 1.5.1. They'll update faster to 1.5.1 now, after the "all-time bigest Usenet attack" last week, as 1.5.1 is the only server protected against this cracking method (well there are patches for some other servers, but...).

This leads to problems for us NOS users, as this versions disable NENNEWS command by default, we receive "502 NEWNEWS command disabled by administrator" and the sessions fails, no news... Well we can post our messages, as they are posted before the get news procedure. Maybe it's time to change NOS's strategy to get news, the NEWNEWS command is supported by less servers each day as it uses on the server more memory and CPU time than any other nntp command.

In the meantime, if you can, ask your news administrator to change his config.data file, partial quote below:

```
----------- 8< ----------- [INN's config.data] ----------- 8< -----------
## Allow the NEWNEWS NNTP command? Pick DO or DONT.
## (RFC 977 says you should; your server performance may not agree...)
##### =()<ALLOW_NEWNEWS @<ALLOW_NEWNEWS>@>()=
ALLOW_NEWNEWS DONT
----------- 8< --------------- [end quote] --------------- 8< -----------
```

Easy to guess, he must change the "DONT" to "DO" in the last line. Perhaps he also needs to recompile INN, or only to restart it, it's not clear for me. While we're with config.data, there is an option (on by default) to slow down service for offline readers. Another partial quote:

```
----------- 8< ----------- [INN's config.data] ----------- 8< -----------
## Do you want to make life easy for peers to pull feeds from you (it's
## harder on your machine). Pick DO or DONT. With DONT, you get a small
## sleep inserted before each ARTICLE command is processed. (With
## apologies to the Australians in the audience).
##### =()<LIKE_PULLERS @<LIKE_PULLERS>@>()=
LIKE_PULLERS DONT
----------- 8< --------------- [end quote] --------------- 8< -----------
```

Same thing here, change last line into "DO", if you have a nice newsmaster he'll do it. Otherwise you have a one second pause between each article. And if someone could explain me the "Australians" stuff...

```
Bye! Bruno.

I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks, Labtec Speakers & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: 1040STF Computers, MonoChrome Monitors, Monitor Master Switch Boxes, Hard Drives, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

It could also be that his power supply is going out. If it refuses to read
an otherwise good disk, it could very well be getting ready to go out.
I've seen it happen on my STE before.

But of course, it could be the floppy drive itself. I have a TOS 1.0 STfm
that has a bad floppy drive. I connected it to a good one, and it worked.

1056. help on connecting a multisync monitor to an ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-25 00:00:00 UTC
From: Dan <daniel.baker@lineone.net>
Message-ID: <01bc396b$ae9add80$LocalHost@daniel.baker>
Source record: 17447

I have just tried connecting my pc monitor to my atari ST, I get an image on my monitor which is almost o.k. except that the image seems to be to wide for the monitor and there is some ghosting, it is as though I have enlarged the image with a horizontal size control on a monitor, and it is reflecting some of the image back round onto the original image, is this because my vertical or horizontal refresh rates are too fast or could it be a wiring problem? The monitors horizontal refresh rate is 31.5/35.5/48 kHz and the vertical refresh is 45-90 Hz.

Dan.

On 21 Mar 1997 20:46:52, Mark wrote:
>I am enquiring on behalf of a friend who owns an atari STFM and would
>like to add a hard drive to it.

Mark,

Your friend will need:

1) A SCSI or SCSI 2 hard drive,

2) A housing with fan and power supply for the above,

3) A SCSI <-> ACSI (Atari's version of SCSI) adaptor. I recommend
the LINK II from ICD, and,

4) Formatting/Booting software for the drive. I recommend ICD PRO
Utilities, also from ICD.

The LINK II comes with software for formatting and booting, but the
'standard' version requires an ICD adaptor of some sort (AdSCSI+,
LINK, LINK II, AdSCSI Micro). The PRO version allows formatting and
booting with any Atari host adaptor regardless of manufacturer.

Unfortunately, I don't have any info on retailers in GB. I will
forward your note to Simon Churchill who has a treasure trove of info.

See ya,

You need to get something like the SCSI version of the Syquest EZ-135
or 230 meg SCSI drive and a host adaptor which changes the signal from
the ST into normal SCSI, like the ICD Link II available from many
Atari retailers or contact ICD directly at www.icd.com
Once you use a HD on a ST, you won't want to ever go back to
floppies..

Mike

>for the PC other than a printer!

The parallel port is bi-directional, the problem is that it is missing
several of the non-essential handshake lines (things like paper out)
which are used by a lot of parallel port stuff like ethernet cards.
You can bodge a DLINK600 parallel port adaptor into the cartridge
port - MiNTnet comes with a driver for it....

He could also keep an eye out for an older Atari Megafile30 or Megafile60
which just plugs straight into the HD port on the back of the STFM.I picked
my Megafile30 up for a mere pitance and find it invaluable for storing my
large collection of midi files and synth patches.

Rob.

>I am using a normal VGA monitor with a VGA adaptor on my falc.

Negative. EGA is digital; VGA is analog. Connecting an EGA monitor to
the Falcon may damage both the monitor and the computer.

Carina BBS the Best, Most Powerful BBS software for any 8bit computer!? I don't know where that came from, but the last time I saw Carina it was written in Basic and didn't impress me that much. (Granted it was an older version) But still BBS PRO! without a shadow of a doubt is the mos powerful 8bit BBS program in terms of baud rate, emulation support, networking, msg base processor and file processor, and online game support. What does Carina do that BBS PRO! can'T?

BTW you may think I own or run BBS PRO!.. no I actually was an 8bit sysop using OASIS 4.7 a few years ago.

Alan

I used to have this happen when I had no internal disk drive
connected. The machine would boot ok with the HD turned on but did the
same thing as yours if I forgot to turn the HD on first, even though I
had a working external drive plugged in the back.

There could of course be other reasons!

Hello everybody,

I am trying to connect my Atari 1040STF to a Pentium PC by a serial link (null modem). On the Atari side I've got UNITERM version 2.0e 002 running. The simulated terminal seems to be randomly choosen. Is it possible to set the UNITERM terminal neglecting any previous setting to a VT100 state? I am able to achieve this from the LINUX operating system running on the PC.

Is there any possibility to access the PC running under Windows 95 from the serially connected PC? Is additional software necessary to make the serial port simulate a terminal?

Thanks a lot for your help, yours Holger

No, the Falcon needs an analogue monitor, eg. SVGA.

EGA monitors are TTL, ie. the pixels are either fully on or off.

This one has been in INN for a while.

I can see someone like a university might want it because a) there is no
good reason why anyone should want an offline reader if they're connected
permanently, and b) if people take a suck feed they'll probably take more
groups than they actually need, and so waste bandwidth.

However, I can think of no excuse for any ISP to have this as DONT,
particularly in countries where people pay for phone calls.

Apparently, using article numbers instead of message IDs gets round this;
but, now there are programs like suck to get a suck feed using article
numbers, new versions of INN may fix this loophole.

You should be able to use that monitor for high-rez - it won't handle low- or medium-rez properly because the horizontal sync in those resolutions is 15.75 kHz, the same as a TV set. High-rez syncs at 31.5 kHz, though. Vertical refresh is 50 or 60 Hz (depending on Euro or US mode) in the color resolutions, 70 Hz in high-rez.

There is a partial listing of monitors that will work (and some that won't) in the multisynq FAQ located on my ftp site (also available through HTTP on the "References" page).

>
>Could I connect the keyboard of MSTE to STE or PC ??

Certainly. Take a look at alt.binaries.atari's recent posts, or if
that's not possible, go to ftp://ftp.teleport.com/users/atari and look
for megabrd2.zip - you'll need a 6-pin telephone jack, whihc is sold in
the US by Radio Shack as Cat. No. 279-420; I don't know where you'd get
one in Espana, sorry. Also pick up a 9-pin female sub-D connector with
the crimp-on connectors that are supposed to be shoved into the back of
the plug - you'll be throwing away the actual plug and using just the
female connectors - and about 6 inches of heat-shrink tubing, to
insulate the connectors after you connect the telephone jack to them.

You can route the wires for the jack out through the extra space around
the STe's joystick connector - that way, the new keyboard jack will be
hidden from view, and protected from accidental bumps.

1081. Software602, Inc.

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-27 00:00:00 UTC
From: Justin Morgan <jmorgan@software602.com>
Message-ID: <01bc3a57$2e7ad960$7c36c4c2@soft602.software602.com>
Source record: 17464

602proINTERNET, automated LAN access to the INTERNET, software allows Local

Area Network to connect simultaneously to the Internet through just ONE
modem dial-up or dedicated, with Firewall, WWW and E-Mail Clients.

http://www.software602.com

602proINTERNET is a communication software package for full connection to
the Internet using dial-up or leased line. If you are a small business
owner
or an IS manager in a small to medium sized company, you have just found
the
software you need. 602proINTERNET allows a number of computers to access
the
Internet through one account. The product includes SMTP/MIME e-mail with
clients for Windows 3.1x, Windows95 and WEB clients for Windows 3.1x and
Windows95. 32-bits Mail602 INTERNET Server provides fast, high-quality
delivery of your messages. Firewall SOCKS solves the security of your
network. 602proINTERNET offers the possibility of using online access to
the
Internet for all users in your network simultaneously for the price of
connecting a single PC.

What can 602proINTERNET do?

"SURF" the NET from any workstation on the network!
The user of each workstation on the network has access to WWW pages of any
WEB site on the Internet. All users on the network can "surf" on the
Internet simultaneously.

Electronic mail for each network user!
602proINTERNET includes SMTP/MIME e-mail with the option to send and
receive
attached files for any user on the network, regardless whether he is using
Windows 3.1x or Windows95. E-mail has many ways of administrating the
users'
rights. Every user of your network has his own Internet address (i.e.
"user@yourcompany.com").

Security!
Our firewall SOCKS solves the security of your network against access
byunauthorized personnel. At the same time you may define access to WWW to
selected users on your network. Security is solved directly at the IP
packet
level and this is why it is reliable.

Only one IP address is all that you need!
You save your money! Your full connection to the Internet using
602proINTERNET requires only one IP address for the whole network. You will

connect your whole network to the Internet for the price of connecting a
single computer.

Available for Dial-up and leased line connections, too!
The software package 602proINTERNET is great for Dial-up as well as for
leased line connections. No more expensive telephone lines!

Unless you own one of those rare multi-sync's that'll go down as low as
15KHz horizontal, you can't connect it to an ST. You could use it for
monochrome if you need to (with some adaptations!!!!!!) but for color you
are SOL.

Although you ask for other ways, I'll write again about Ghostlink, for I had some simila problems:
1) Maybe you will need to adjust the serial port parameters on the Atari with some control program.
2) If you have a resident mouse driver in DOS, and if you want to use the same serial port, then better skip the loading of the driver in your AUTOEXEC.BAT.

I am sorry I can't say it will work for sure, because I haven't tried it with a 3-wire cable. But check out the two things above.

I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks, Labtec Speakers & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: 1040STF Computers, Spectre GCR Macintosh Emulators, MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Hard Drives, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I

will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

You must be kidding ! Brand new HP200LX sells for $445 in Office Max
as reported by someone a few days ago. $300 seems fair !

1092. TT Fast RAM card info

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-28 00:00:00 UTC
From: oskancke@sn.no
Message-ID: <5hhlb7$o9e@news1.sol.no>
Source record: 17475

I have some questions about the Atari TT-FastRAM card made by Atari. It is the 6-jumper card that I want to know more about. What I want to now is what the different jumpers are for and how much ram you can put into this card. What I in particular want info about is how the Burst-Mode works and what it does to performance. Also I need to now what type of ram is best suitable for this card, both without Burst-Mode enable and disabled. I currently have 4 x 4MB 80Ns SIMM's on my card now. Can I use Burst-Mode with this type of ram, or is 80Ns to slow?. Any help and info would be very much appreciated. Thanks

I need info from owners of the Hades 040/060, Medusa040/060 or Direct040/060 on what software works and what doesn't. I know that the Hades and Direct0x0 is different from the Medusa0x0. (I also know that Medusa is the producer or the Hades, and that the Direct is actually a Hades, but assembled in Canada). So, I would like for anyone answering to this letter what machine they're using. I have heard rumors that the Direct and Hades doesn't implement DMA? What effect does that have on compatibility with existing Atari software? And most important, does MiNT work? Linux? Please you powerTOS owners out there, let me now! Thanks.

1096. Problem with ICD Link2 and IBM DPES31080 HD

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-29 00:00:00 UTC
From: chrisc@zetnet.co.uk
Message-ID: <5hhns3$v6j$1@roch.zetnet.co.uk>
Source record: 17479

Hi People,
I've got a problem with a Hard-disk I'm trying to add to my system. I'm using a TOS2.06/1.62 STE, 4Mb, Mono. It's already got a 100Mb IBM HD, a 210Mb Quantum HD and a single-speed Sony CDROM. All of these and the new hard-disk, an IBM DPES-31080, are mounted in a PC case which is hosted to the Link2 by a SCSI-Burster cable. Basically it is an internal to external SCSI cable mounted on a PC expansion bracket. the ICD software knows the DPES-31080 is there asd it reports it at ID3 during boot-up, but when I go to format the drive it won't report how many sectors and cylinders are available. Is this information held in a text file somewhere or should the ICD software be getting it from the drive itself?
If I format it with HDDriver or some other HD tools like the Gesoft ones would I be able to then use it with ICD instead, or...
if I get HDDriver or whatever, can I continue to use my current drives as they are or do I have to reformat them with the new software and re-install all my stuff. I need an extra drive for redundant back-up space while I'm writing a book on synth construction. The alternative would be to see if I could swap the DPES for an old Syquest 44Mb or similar cart-drive. Can anyone recommend any of the assorted removable media things for use with ICD? I can't really afford an EasyFlyer, I get the feeling that disks for the Easy135 are going to get hard to find and I don't like the Iomega ZIP very much from what I've seen at work. Do the old Floptical's work well, and are the disks re-writeable? I could probably swap the HD for something like this via the small ads
Please reply to my email address.....chrisc@zetnet.co.uk as I no longer have particularly good News access, I can send it but recieving it can be a hassle....

Source record: 17480
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've been using a PC for several years, but I have an Atari ST (MEGA ST2) sitting around and I was wondering if it could be used to get onto the internet(for my kids). I recall that GENIE and COMPUSERVE once supported this platform.

If it is possible, how well would it work, what would I need to do, etc. Any helpful info would be greatly appreciated.
I have an old modem (Atari 1200?) somewhere, but of course I would think something faster would make sense.(Any external modem plugged into the serial port? -but how about the software?) How about the internet service provider? Anyone have any suggestions?
It really was/is a good computer but unfortunately, not well supported.

Thanks for any help - RLee3846@AOL.com

The info comes from the drive. Have you verified that parity is turned
off on the new drive? Link-2 should handle parity, but all drives must
be set the same way. And it's also possible that you have a flaky
drive, or a flaky cable.

>If I format it with HDDriver or some other HD tools like the Gesoft

Re-formatting isn't required if you have formatted with the "AHDI
Compatible" option in ICDFMT. I don't know for sure otherwise - but I
highly recommend HDdriver; I changed over from ICD myself recently and
the performance increase (and reliability increase) has been quite nice.

1100. ST memory upgrade

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-29 00:00:00 UTC
From: "Bob.Peilow" <bob.peilow@dial.pipex.com>
Message-ID: <01bc3c9b$2e637a40$2af882c1@default>
Source record: 17483
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Can anyone help with a memory upgrade? I'm looking for at least 0.5 meg for an STFM.

Ideally I'd like more than that, or one of the add-in SIMM sockets that Evesham Micros did about 5 years ago (I've asked, they sold them all)

I don't mind second hand or stuff that has been sitting in a stock room for a while, as long as it works!

email bob.peilow@dial.pipex.com or djp495@soton.ac.uk if you have anything.

Cheers
Dave Peilow

Really,well now add tax to that $445, then the cost of a serial cable and ac adapter and the cost of ACT for palmtops,the cost of a 14.4 fax modem and a 4 meg flash ram card and the Simtel cd-rom of dos programs and your probably looking at nearer $600,so $450 is a fair price,but as I said I'm looking for offers.Lastly,have you actually confirmed the price at Office Max or are you just going on hearsay? Was that a 2meg or was it just a 1 meg? Here in Canada I'm still seeing the 2meg HP selling for approx. $850 cdn($640us approx.)

i used to use an st and yes, it can be used on the net, not very good for
the web because of memory restraints but it's as good as anything else
otherwise.
as for the software, i'd have to look into that.

Well, you don't mention how you access the port. The Parallel port is access through PSG register #15. (PSG Programmable Sound Generator, Sound Chip). All PSG registers are accessed by the CPU via two registers, one that acts as a select register/data read and one acting as data write. The select/data read register is at $ff8800 and the write data is at $ff8802. Ok, there is more that needs to be done, like setting port B (PSG register #15 is called Port B and its 8 bits represents the eight data lines of the centronics interface) to output, and using the strobe line. But right now I have got to go. I'll post more info on this later today if needed.

what memory restrictions?, CAB works alright on a one meg ATARI, or it
did when I was using it for months, and that was when it was first
released, since then its been improved,

Add to that the fact that most on the net will have more than one meg,
then what are these memory restrictions you talk about???

just wondering ??

Just try to connect everything up and do a quick test.
Boot from a system disk and test if a HDrive is seen...

It worked for me, the first time

Steph

> I have some questions about the Atari TT-FastRAM card made by Atari.
> It is the 6-jumper card that I want to know more about.
> What I want to now is what the different jumpers are for

W101, 102 and 106 should have jumpers on pins 1 & 2 if you are using
4MB SIMMs.

> and how much ram you can put into this card.

4 x 4MB

> What I in particular want info about is how the Burst-Mode works and
> what it does to performance.

It gives improved performance.

> Also I need to now what type of ram is best suitable for this
> card, both without Burst-Mode enable and disabled.

IIRC with burst mode enabled use nibble mode DRAM

With burst mode disabled you could use fast page mode DRAM.

> I currently have 4 x 4MB 80Ns SIMM's on my card now.
> Can I use Burst-Mode with this type of ram

Only if the DRAM is nibble mode, check the DRAM part number.

> or is 80Ns to slow?

No.

> eric, on a roommates pc

Well, I must warn you ! I upgraded my atari's TOS to 2.06 some years ago. The user-interface is a good improvement so I was very satisfied, in the beginning. That was until I began to experience lots of troubles with certain 'older' programs. The programs just weren't compatible. Some programs just didn't run anymore !
If you still want to upgrade to a 'new' TOS. Well, I don't know any channels to get it from. I myself have put in a copy of the ROMS made into EPROMS. So I exchanged the original 6 (?) ROMS with 2 eproms. Needed some serious electronic hardware adjusting to work, but it did. The new TOS does seem to go faster than the original one. My advise, try finding a computer with the new TOS installed and try running all of your usual programs on it so you won't be dissapointed after upgrading. Try find a shop to get the new TOS, the original ROMS are pretty easy to build in. But be sure to get the right ROMS ! I remember something about different versions of ROMS for the 520 and 1040 ST. And because your computer has been converted from 520 to 1040 it probably would be advisable to ask the shop to examine your computer first.

About the mouse. I got a Qtec mouse that was very cheap. Works great ! It comes with a plug to be able to use the mouse on an atari, amiga and mac. But, I bought the mouse some years ago, so I don't know if it's still in the shops. Just ask around in some computershops for an atari-compatible mouse.

Hope this will get you somewhere.

Lars.

I didn't say it was Canadian,it's us dollars and for your infomation it's
already sold for $400 us without the 4 meg card or 14.4 modem.

MAIL SERVERS
------------
Mail servers can be used to get hold of the same software as through FTP,
but instead of using a lot of download time online, files can be 'ordered'
via email.
In order to get information about how to do this, send an email to the
various addresses below with the word: help
in the mail itself. If possible, do not include any 'signature' in the mail,
as the automated system which replies to these mails tries to interpret any
message (and with a certain amount of errors no response to your requests
will be given at all).

NetBSD 1.2 current is running on a HADES 040. I don't know if it also works
with a 68060. It supports SCSI, (E)IDE and modem 02. Look at
http://www.netbsd.org/. Also running is the XFree W32 accelerator X-Server
For more information about the kernel write to: leo@netbsd.org, for more
information about the X-Server write to me.

Greetings
Thomas

1117. connecting to Demon, but no modem/IP traffic!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-03-31 00:00:00 UTC
From: Marc CR Bouron <marc@lobotomy.demon.co.uk>
Message-ID: <199703311923.AA00944@lobotomy.demon.co.uk>
Source record: 17400
Cross-posted to: demon.ip.support.atari,comp.sys.atari.st.tech

Hi Folks,

I'm using NOS on my ST to connect to Demon. Most times I initially attempt to connect, I get through OK, past the login and motd, but then it all sort of hangs quietly doing nothing - there's no traffic going through the modem.

I've rummaged amongst the various commands for clues, and the only one that looks promising is "ppp sl0", which gives:

```
Physical line dead.
[...various numbers...]
LCP Listening - waiting for remote host to attempt open.
[...more numbers...]
IPCP Listening - waiting for remote host to attempt open.
[...more stuff...]
```

Does this mean anything to anyone? Unfortunately, it doesn't to me. Is there anything I can do to prod it into life? Otherwise I just wait for it (or me!) to timeout, and start again (which may or may not then work).

Any clues would be gratefully received.

Cheers,

[M][a][r][c]

From: Dan Phillips <xiting@worldnet.att.net>
Message-ID: <33409789.5C3A@worldnet.att.net>
Source record: 17404

Well, I finally got the Falcon to boot with a replacement processor. I now have a 33 MHz '030 powering my bird from the motherboard! The only problem is that it refuses to see my SCSI drives. I'm concerned that in the process of powering up the machine first with an apparently defective '030 (purple/black screen, no smoke) and second with an EC030 (white screen with Fuji logo and no more), I may have fragged the SCSI circuit. Any ideas?

Thanks,

Dan

Well, the problem seems to be caused by a failure of the bios.
Maybe you upgraded your bios-rom with eproms ?
Try and refit the bios-roms, well, just press them hard into the sockets
and look for misfitted pins. It's a wild guess, but it's worth the try.
I trust you know which chips the bios-roms are, if not, let me know.

The problem could be lying within the floppy controller. This is a chip
with the WD1772-PH code. Try to exchange this chip with one from
another, well functioning, atari. If this is solves the problem, just
try and find an exchange chip. I don't know where to find one cause I
haven't been doing much hardware stuff the last few years. But they
could be hard to get. Anyway, good luck !

Lars.

1123. Use only TOSv2.06 under Pacifist

1125. AHDI chokes on files >1M

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-01 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <417cd$1482e.218@HERMES>
Source record: 17408

I have run into problems when copying files over one meg between hard disc partitions. And sometimes from my 2 meg ramdisc to hard disc.

(I use a 20 Mbyte TT [4 ST + 16 TT RAM] with TOS 3.05)

I've had this problem when the system is running MiNT, and when it isn't.

It even occurs when the system is running nothing except the GEM Desktop.

Most of the time the system just ends up hanging, leaving me to reboot.

I am using AHDI 6.06.

I use AHDI 6.061 & recently created a 180 Meg tar file with no problems.
I use a 4 meg STFM.

I used to have problems like you now have, They were caused by a bad SCSI
cable. I used to get system hangs or bombs.

The problem was not easy to solve, because the cable tested o.k for
resistance & proper connections.

It was intermittent & only when drives began to 'disappear' did I suspect
the cable. I have multiple SCSI drives, & sometimes a drive would become
disconnected during a transfer. On rebooting, the drive would re-appear.

The only symptoms I got were a frozen mouse pointer or bombs.

When I started using Minix filesystems, I used to get a 'Rwabs' message
about a drive just before the system hung. This helped to track down the
problem.

Your problem may be different however.

Sorry, but it seems that the initial trouble was caused by a defective
medium. A friend of mine have tried to format the medium on a windoze
machine. The only thing he gets is a system hang.
I've tried it with a new medium and yes formatting works indeed .

Until 27C512(27C256?), eproms and roms are pin to pin compatible.

This is no more true with 1Mbits and up.

So on stF, you can put roms or eproms(6 chips version only) without
any modification.

Thierry.

Hi!

Recently I connected a 121 Meg IDE 2.5" Conner to my Falcon. Just
plug the cable in the drive and connector, and it's working, no jumpers,
no anything else. There is a Falcon internal HD kit you can get from ATY
computers (and other distributors by sure). It includes the cable and a
stand for the driver with all the screws.
Be sure to have the HD driver in the booting diskette to test the
drive.

Regards.

Daniel.

>relevant info?

Be very carrefull, VERY OLD pc mouse with ps/2 connector are hardware
compatible with atari mouse(just rewiring is necessary).

Currents ps/2 mouse seem to be a 0-5V version of serial(rs232) mouses.
They seem to be as pc keyboard. For example, put a ps/2 mouse in the
ps/2 keyboard connector give no error message as "Keyboard error".
ps/2 keyboard are fully compatible with standard pc keyboard.

1137. Remote cartridge port > help !

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-01 00:00:00 UTC
From: dipching@ping.be
Message-ID: <859934832_OASIS_@ping.be>
Source record: 17420

Hello everyone,

I have now put my TT in a home made tower and everything works fine
with the brand new pc power supply ... everything is done except one
.. I need to put my cartridge port on the back of my tower ... I have
already spent a few hours to solder a remote cable ... to make things
clean I have cut an old cartridge circuit board to plug in the genuine
TT port ... from there I have soldered a flat 40 wires cable to the
external female connector which is now on the back of the tower ...

I have tried to use the new cartridge port and it seemed to work well
(e.g. with my X-Alyser DX7 sound editor which need a cartridge to
make the program run) until I remarked some little annoying things like
my Video Master doesn't work perfectly now ... still pictures are always
moving (not quite as stable as before) when I try to take a color
shot... and obviously, it doesn't happend on the genuine port ...
Also when using my TT diagnostic cartridge it doesn't go to the main menu
.. and obviously it doesn't happend with the genuine port ...

What is the problem ? Each wire is connected to each other with very
clean soldering work and high secured correspondance ... I have
verified connections almost then times. Is it the lenght of the cable ?
Must some wires be soldered together ? I really don't understand.

Note : even when a connected cartridge (like Video Master one)
everything works perfectly with the whole computer except there is
something wrong (or missing) when working with the corresponding
software.

Can someone help ?
Thank you

1138. Printer/Modem Problem!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-01 00:00:00 UTC
From: jdaddin9@airmail.net
Message-ID: <5hrt40$7aa@library.airnews.net>
Source record: 17421

I have a seemingly strange problem with my system. When my printer is connected to my computer, the modem will not connect properly with my internet provider. When it is unplugged it works every time without a problem. I am using FreeMiNT 1.12 & MintNet 1.01 to connect to my provider. I have a Falcon w/14meg and am using HSMODEM07. One other rather odd thing is, when I was using an Intel 14.4 modem, this was not a problem. This seems to only occur with my current Supra 28.8. Any ideas to a solution would be greatly appreciated!

Thanks.

-Jared

o> Any help and info would be very much appreciated. Thanks.

I'm beginning to learn about this subject too. I have the information about the Atari TT-RAM board, which is posted below, but if anyone can confirm the settings for a GE-Soft board which takes 8 SIMMs I would be very grateful.

From: magee@cpsc.ucalgary.ca (Russell Magee) Date: 07 Oct 96 16:16:04
Subj: Re: TT RAM jumper settings
---------[COMP.SYS.ATARI.ST.TECH]----------
I had trouble with the 2 and 3 chip SIMMs, the TT would crash after about 5 minutes. I returned them and asked specifically for 8-chip, no parity 4 meg SIMMs (70 ns). These have worked for me without a hitch. I think the brand I got was Hitachi.

Also, someone posted the jumper settings needed for 4 meg SIMMs,
(Thanks to dawinic@unity.ncsu.edu for the original post!) here's the info again:

The jumpers required on a TT-Ram board (CA401058-xxx) are:

SIMM type jumper W101 jumper W102 jumper W106
1M x 8 2 - 3 2 - 3 2 - 3
4M x 8 1 - 2 1 - 2 1 - 2

Starting RAM Address jumper W103 jumper W104
$0100 0000 2 - 3 2 - 3

Address Mode jumper W105
NON-BURST 1 - 2
BURST 2 - 3 (default)

What version of Big-DOS did you use? As far as I know the current
version 8 doesn't work well on Falcons. (For the ST/TT it works.) So for
the Falcon version 6 seems to be a better choice.
Which the correct version of Big-DOS and curren versions of HDDRIVER
PC-compatible partitions up to 2 GByte are recognized. What's the
version of HDDRIVER you used?

Your Supra is pulling DCD high by default, I think. I assume you're set
for Modem2 as your serial port. Clearly, it's a difference between the
Intel's settings and the Supra's (and since Intel pays my rent, I tend
to blame Supra <G>).

Check the manual and see what command you can send to the modem to
cahnge the behavior of the "carrier detect" line, if any (usually there
is one).

Thanks for the help,I have the drive installed and running great.I
installed it using a home built mount which seems quite sturdy,it certainly
boots a lot faster from the internal drive than from the external
scsi,which is great as I hated having to have a disk in the floppy drive.

Rob.

You're getting signal crossover between data lines. Make another cable
but use two 40-pin ribbons - one laid on top of the other. Solder all
of the odd-numbered pins on one ribbon to the even-numbered pins on the
other ribbon at one end only - leave the other end insulated. Ground
the assembled wires (there are now 40 grounded wires) and use the
remaining wires in each ribbon as the usual signal wires between the
computer and the external jack. This should eliminate about 90 percent
of the noise.

I think you need some special tooling. A disk drive has some very high
precision mechanical parts that can only be fixed with that tooling.

My guess is that it will probably be cheaper and easier to get a new
drive.

Just copy (version 6.061) of AHDI.PRG into the same folder as the boot
sector installer. Rename AHDI.PRG to SHDRIVER.SYS & run the installer.

>wanda@xnet.com

As far as I know there is no such thing as a system disk for Atari (except for the very first STs with TOS 1.0 on disk). TOS is in ROM, so you can boot with any old formatted disk. If you don't have a formatted disk, you can boot without a disk and wait a few minutes for the desktop to come up. Then you can format a new disk with the desktop menu.

If you are talking about the software that came with the machine, I'm not sure exactly what it was for the Falcon, but the ST 'language disk' stuff was mostly useless, except for control.acc which can be nicely replaced by xcontrol.acc on all machines. This can be found an all the major FTP sites.

Does anyone know what exactly came with the various language disks?

My first STFM had
-control.acc
-logo.prg (a useless logo interpreter)
-stbasic.prg (a useless and buggy GEM basic)

My STE came with
-control.acc
-omikron basic, which was a major improvement

What about other machines ?

1151. MegaSTE keyboard..... help

Newsgroup: comp.sys.atari.st.tech

The Falcon's system disks came/come with Breakout, CalAppt, Landmine,
ProCalc, Talking Clock, Audio Fun Machine, Falcon D2D, System Audio Manager
(SAM), various sounds, an installation program, XControl 1.2, various CPXs,
AHDI 6.06 (and accompanying programs), Lines, MultiTOS 1.x, Atari Works 1.2,
and SpeedoGDOS 4.x. As for sending these files, I'm not sure about the
legality of doing so. If anyone can tell me for sure as to whether I can
send most of the system disks (obviously, I wouldn't be sending MultiTOS,
SpeedoGDOS or Atari Works, as these are most certainly commercial programs),
then I would be happy to set up a web page for the two Falcon owners to get
the files from. (I must say though, Atari did load the system disks for the
Falcon to the brim, didn't they? :))

I've noticed the same results when using PC IDE drives of Falcon. When I tried SCSI PC drive it worked out just fine...I tried Seagate 1,7Gb and Quantum Bigfoot 1.28 drives, which had all partitions under 500mb and they didn't work.

I believe all of the other files are already available from major ftp sites,
so I see no reason you couldn't collect them all in one place. MT, Speedo,
and AW are all available commercially, and while I would personally
recommend NVDI over SpeedoGDOS, anyone who's really interested should hit my
"vendors" page to locate someone relatively local to them (e.g., same
hemisphere) and inquire about pricing. Frankly, I haven't been all that
impressed with MT on my Falcon - but it's tolerable on a TT, so once I can
get Nemesis, perhaps it will be nice on the Bird as well.

No, I'm not Sanford Wallace - just baiting the spammers. <G>

To the STe, yes. To the PC, probably not.

Get ftp://ftp.teleport.com/users/atari/megabrd2.zip for graphic
instructions. I have recently done this for my Falcon and it works quite
well. I would advise adding a couple of "flying" leads so that the pilot
light and drive busy light on the old keyboard still work with the new
exteranl keyboard connected, but that's very much optional - mine aren't
connected, so I just use LEDPANEL.PRG in the AUTO folder.

From: Jean Marie Bussat <bussat@lapp.in2p3.fr>
Message-ID: <3342930C.4093@lapp.in2p3.fr>
Source record: 17442

Hi,

I've got an Atari SLM804 laser printer for one week. It works fine but I'm curious and I'm looking for a kind of hardware manual (something containing extensive information on hardware, mechanical parts and so on...).

Does anybody have anything like that. Perhaps there is a place where I will be able to purchase such thing. I'm ready to buy this kind of information if necessary.

I have read long time ago that this printer include a diablo interpreter. Any kind of infon on this language ?

Thanks for any kind of help.

[Deliberately slow down offline readers]
>Apparently, using article numbers instead of message IDs gets round this;
>but, now there are programs like suck to get a suck feed using article
>numbers, new versions of INN may fix this loophole.

If I correctly understood the piece of INN 1.5.1 code I've seen
commented in a French newsgroup, it's already done. BTW NOS can't use
article numbers, just message-IDs. In commands "ARTICLE <message-ID>" if
there is no kill file, "HEAD <messID>" and then perhaps "BODY <messID>" if
a kill file exists.

Do you know if like someone said me all these commands are slowed down
(by default) or only "ARTICLE"?

Bye! Bruno.

I also get curved pictures on my Iiyama, but only in the more demanding
resolutions. For me the problem can be solved by increasing the vertical
top and bottom borders. It seems as if there isn't enough time for the
monitor to stabilise after a vertical flyback.

->: >Ditto for me. I bought a used Falcon030 but there were no system disks.
->: >I am also interested in acquiring a copy of the system disk(s).

-> The Falcon's system disks came/come with Breakout, CalAppt, Landmine,
->ProCalc, Talking Clock, Audio Fun Machine, Falcon D2D, System Audio Manager
->(SAM), various sounds, an installation program, XControl 1.2, various CPXs,
->AHDI 6.06 (and accompanying programs), Lines, As for sending these files,
-> I'm not sure about the legality of doing so. If anyone can tell me for
-> sure as to whether I can

Just wondering, but what if I bought a PC, and the HD crapped out and I
lost everything. Then my friend comes over and we copy DOS and Windoz to my
new HD. Is that legal? Did I not pay for DOS and Windoz when I bought the
PC?

->send most of the system disks (obviously, I wouldn't be sending MultiTOS,
->SpeedoGDOS or Atari Works, as these are most certainly commercial programs),

Whats the difference between those 3, and the other programs listed ? Are
the others freeware? Or a better question would would be, "How could Atari
package commercial software with their Falcons?". This is a hot item with
me, as I didn't get anything when I bought my used Falcon, not even the
manual.

Don't have a cow, man; its not your fault.

->then I would be happy to set up a web page for the two Falcon owners to get
->the files from. (I must say though, Atari did load the system disks for the
->Falcon to the brim, didn't they? :))

Thanks, if its legal count me in!

AFAIK Atari released all those programs. TAF has had them on their BBS
for a while now. However SpeedoGDOS, AtariWorks, and MultiTOS have _not_
been released by Atari. Atari couldn't release Speedo in any case as it
is not their program to release. As to how Atari could pavckage
commercial
software with their Falcons, wellll... how can IBMclone dealers sell
Microsoft, Lotus, WordPerfect, etc software on the hard drives of the
systems they sell? simple: they buy a licence. In Ataris case they would
have had to only buy a licence for Speedo, as the rest of the software
is
Ataris. I also purchased my Falcon used, but managed to get all the
software
and manual form the original owner (thanks Kevin!)

From: Marko Haas <unix111@ai.fh-nuernberg.de>
Message-ID: <3343CCE8.167E@ai.fh-nuernberg.de>
Source record: 17351

Hi,

this is for all Atari users who need performance and don't mind an
external power supply.

I want to give away my Atari Mega ST4 for a small amount of money. Over
the last ten years, I added following hardware:

- a 100 MB external SCSI drive
- an ED disk drive (2.88 MB) with Ajax controller
- an ET4000/W32 graphics card
- a 50 MHz accelerator board with
+ a 68030 CPU (the version without internal FPU/MMU)
+ 4 MB fast RAM (plus 4MB on mainboard makes 8 MB)
+ compatibility switch (activates 68000)
+ 68881/68882 socket

Please mail to

unix111@ai.fh-nuernberg.de

or

MarkoHaas@aol.com

Thanks
Marko

1168. Seagate ST 5660NC

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-03 00:00:00 UTC
From: jamal@blacklotus
Message-ID: <5i0df4$161@client2.news.psi.net>
Source record: 17352

I would like to know if anyone has gotten a Seagate ST5660NC to work in an enclosure with an ICD ADSCSI Plus. The adscsi can see it on the SCSI bus, but when I try to run the formatting program, it says to make sure the hrad drive is on. This drive might be a SCSI2 interface, because it has the small card that has the 50 pin interface and a jumper block for setting the scsi ID and other parameters.

1169. Re: Info: Can someone email me details on the Falcon 0

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-03 00:00:00 UTC
From: fvdakker@mrose.nl
Message-ID: <8601089733601@wise.mrose.nl>
Source record: 17353

RB>Hi, can someone email me a description of what all the jumpers do on a
RB>Falcon 030 or direct me to a relevant web page,thanks.

Two configuration switches are provided for the enabling or disabling of
hardware options on the main logic board. The switches are located at
U56 and U57.

NOTE: IT IS RECOMMENDED THAT THESE SWITCHES NOT BE CHANGED AS
PROBLEMS COULD RESULT FROM THEIR IMPROPER SETTING.

The values of these switches is as follows;

U56
Segment Function
1 On = 1 Wait State DRAMs
Off = 0 Wait State DRAMs
2 On = 32-bit Video Bus
Off = 16-bit Video Bus
3-4 Off Off = 0 Wait State ROMs
Off On = 1 Wait State ROMs
On Off = 2 Wait State ROMs
On On = Reserved
5-6 Not used
7-8 Not used

U57
Segment Function
1-4 Not used
5 Off = Quad Density Floppy
On = Don't Care
6 Off = AJAX Installed (1.44 Mb)
On = 1772 Installed (720 K)
7 Off = No DMA Sound Hardware
On = DMA Sound Hardware Installed

...
This information comes from the Atari Falcon Service Guide (AFAIK from
Atari self).
I don't take resposability for having made a typing error, nor for
errors in the guide!

I couldn't find something about jumpers, but if you can tell me were
they are located, I'll take a closer look.

Greetings,

Frits.

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Has anyone compared files after copying with Kobold? (or any other
copier for that matter).
Yesterday I copied 4,000+ files to an empty partition, and when I
compared the copies to the original using Tree Check(or check tree?)
I had 7 mismatched files.
Is that an acceptable error rate(~1/10th of 1%), or should I be
looking for 0%?
any experience with this?
I am going to try it again, this time with Uwe Seimets HD Driver
"SCSI Verfiy" turned on.

Does anyone know the limit on the number of files in a directory/folder?
I am getting wierd stuff happening with my acc's and cpx's.
For example I can see cpx's in my directory(on a different drive) and
xcontrol will see *some* of them, but not load them. Freedom2 demo only
sees very few cpx/z's compared to what I can see from the desktop.
For acc's I can't see some acc's that I just copied to my acc directory!
Sooo, I was thinking that I had too many acc's and cpx/z's in my
folders, passing some theoretical limit on the number of entries per
directory.

With your PC, you will receive a CDROM or multiple disks for which to
reinstall DOS and Windoze, if it becomes necessary. In fact, most PCs don't
get the full version of Windows, but an OEM version that would only work for
that particular machine (i.e. set up specifically for the features found on
that machine), so you're taking a chance in installing a set from someone
else. However, it is not legal for you to install someone else's version.

: ->send most of the system disks (obviously, I wouldn't be sending MultiTOS,

The difference is that those are still commercial programs, available from
reputable Atari dealers, and to use your PC analogy, just because Compaq
includes Windblows on a friend's PC doesn't not mean it's freely
distributable. All three of those programs were owned by Atari Corp., and
were sold to private concerns after the initial release of those programs
with the Falcons. Not all Falcons received that package, not even if they
did get the 85 meg HD, only the 'first' Falcon owners.

: ->then I would be happy to set up a web page for the two Falcon owners to get

: Be very carrefull, VERY OLD pc mouse with ps/2 connector are hardware
: compatible with atari mouse(just rewiring is necessary).

PS/2 mice are basically serial mice which don't use a serial port; that's why you can get a plug that converts between the two. Also for that reason, a PS/2 mouse isn't Atari compatible (at least, not through the mouse port). Only a bus mouse (which has the required 4 separate Up, down, left, right signals) can be rewired for an Atari mouse port. If anyone's interested, I've got a text file sitting around describing just how to do this.

>Thanks for helping me (Is there a site where I can download it ??)

No, but in case there is it's illegal as TOS is a commercial product, so
you have to buy it.
Atari users here on the net are generally pretty aware of this kind of
thing and much against software piracy- because we want to keep the
platform alive.

Try contacting an Atari dealer near you and ask if you can buy the TOS you
need. Good luck.

It is SCSI-2 (Fast SCSI-2 to be exact) and it should work fine with the
AsSCSI+ - take a look at
http://www.seagate.com/cgi-bin/view.cgi?/scsi/st5660n.txt fro the
details. You want to make sure the "remote start" jumper is off.

You don't need to "format," either. Just partition it. SCSI drives are
factory-formatted.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks, Labtec Speakers & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: 1040STF Computers, Spectre GCR Macintosh Emulators, MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Hard Drives, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture & even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I

will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

I recently copied 3000 + files from one partition to another (and back again).

I checked the files before and after copying, there were no problems.

I would not accept any missing/corrupted files after a copy operation.

BTW, I used the desktop to copy; it is not able to cope with files that
have long file names (Minix partitions may have these).

I have no experience with Kobold, but have experienced problems with 'cp'
in shells, where it was not able to copy files because of strange
characters in the file name.

I am using a 4 mbyte STFM (TOS 1.04).

Hi all!

I'm going to try to attemp the 38000bps upgrade with the 74LS74 chip but I
have a few questions before I start!

Does anyone have good reliable ENGLISH docs on how to do this
modification?

I would like to hear from a few of you that has done this mod.
I have a 1040 STe 4meg tos 1.06 and at the moment only a USR 14.4
but if I accomplish this mod I will ofcourse be upgrading the modem! :-)

I have german docs and the guys tried to transcribe them to english but
left out alot of things!

Thanks
Johnny

Yep that would be fine, you will have bought a Licence to use the
products, they should be the same versions though.

> ->send most of the system disks (obviously, I wouldn't be sending MultiTOS,
> ->SpeedoGDOS or Atari Works, as these are most certainly commercial programs),

> Whats the difference between those 3, and the other programs listed ?

These are commercial.

> Are
> the others freeware?

Xcontrol, The CPXs & AHDI are in the Public Domain, I personally don't
know about the others.

> Or a better question would would be, "How could Atari
> package commercial software with their Falcons?".

They licence it from whoever makes it. The software isn't Free, the
price of the licence is included in the total price.

> This is a hot item with
> me, as I didn't get anything when I bought my used Falcon, not even the
> manual.

I really don't know how you stand legally. You can normally transfer a
licence by simply giving ALL copies of the software to another party, if
the person still owns the software then it would be illegal, if they

don't then I suppose that the licence would have been included with the machine and you are entitled to own the software.

On 30 Mar 97 I wrote to *oskancke@sn.no*: ...respect, brethren
HS> I'm beginning to learn about this subject too. I have the information
HS> about the Atari TT-RAM board, which is posted below, but if anyone can
HS> confirm the settings for a GE-Soft board which takes 8 SIMMs I would
HS> be very grateful.

In answer to my own question I've obtained the following information from
System Solutions:

A GE-Soft board has just three sets of jumpers - J0, J1 and J2 - and 8 SIMM
slots arranged in two banks of four.

SIMM Slots Jumper J0 Jumper J1 Jumper J2 Total

4*1Mb 2 - 3 2 - 3 2 - 3 4Mb
front bank

8*1Mb 1 - 2 2 - 3 2 - 3 8Mb

4*4Mb 2 - 3 1 - 2 2 - 3 16Mb
front bank

8*4Mb 1 - 2 1 - 2 2 - 3 32Mb

4*4Mb front 2 - 3 2 - 3 1 - 2 20Mb
4*1Mb rear

(I may have got that last one wrong - I lost my notes... it may be 1-2 for
all three jumpers - oops)

Another route, for those of you in Europe, is to look for a "Schneider
bus mouse;" it's already equipped with an ST-compatible plug. I have
one right here on my TT and it's the best mouse I've ever owned, even
better than the Golden Image that's on my Falcon. In the US, it's sold
by Best as the "Best Mouse" but it's pricey here.

>else. However, it is not legal for you to install someone else's version.

Hmmm, well, the legality part is correct. However, the OEM version is
customized only to the extent that it may have customized wallpaper, and
sometimes some drivers for a particular set of hardware. ALL systems
either come with the CD, or have the "original" disk images on the hard
drive (and the purchaser is supposed to make floppies as soon as he
turns on the system the first time), or there is an offer in the
documents somepalce to sell you a set of disks. I won't discuss the
ethics of such an arrangement, but any version you can get should work.
If you want a legal set, I have Windows NT 3.51 and 4.0 available on CD,
and will part with any or all copies (I have several of each) for about
half of the current street value. I can probably obtain Win95 if you
want that.

> The difference is that those are still commercial programs, available from

I can vouch for that. Mine came with MultiTOS but NOT Speedo or AW.
Oh, hey, I'll gladly swap WinNT 3.51 for a complete AtariWorks!

It's not a languae, it's an emulator that runs from the AUTO folder and
makes all programs think they are printing to a Diablo daisywheel
printer. It should be on one of the disks you got with the printer.
Frankly, it's interesting but GDOS gives MUCH better results if speed is
not as important to you as quality.

>the assembled wires (there are now 40 grounded wires) and use the
>remaining wires in each ribbon as the usual signal wires between the
>computer and the external jack. This should eliminate about 90 percent
>of the noise.

I have built the cable you were talking about, it works better than
the first but, obviously, there is yet a problem with the Video Master
cartridge ... it don't accept any lenght added to the normal way ... I
even have tried with a 15 cm lenght cable (which is really a very short
one!) and the problem of unstable picture subsists ... then I have
abandonned the idea of using a "remote cartridge" output ... I have made
a hole in the top of my WoodTTower to make possible direct cartridge
connection from there ... and everything is working like before ...
But thank you for the help.

Source record: 17375

Hello.
I wish to use a STAR matrix printer with the Atari. In a german book about Atari ST I've read, a non-Atari printer could *destroy* the chip U19(YM 2149 or AY-3-8910), if the Pull-Up-resistors? are less as 3.3 kOhm each. I don't know what these resistors are and what could I do to avoid such problems.
Can anybody tell me?
Regards

Guentcho

> service provider? Anyone have any suggestions?
> It really was/is a good computer but unfortunately, not well supported.

It /is/ possible to use an Atari with the internet - I'm using one
now!

An ST will take practically any external modem, but be warned - the
serial port only works at a maximum of 19200 bps without
modification, so a 28800 modem would not really be worth it - get a
14400 baud external one.

The software most people use is called STiK (ST Internet Kit) and is
available (for free) from http://www.flinny.demon.co.uk, among other
places. It's quite easy to set up, and quite a lot of software is
available. 2MB of memory should be enough for everything, but it may
be worth getting a version of GDOS and some fonts to improve the
display in the WWW browser, CAB.

All your ISP needs to do is to support SLIP, and be able to give you
relevant information regarding the login etc. If you're lucky,
someone may already have created a script file for STiK for use with
this ISP.

Hope that helped...

Adam Foster

Are you talking about the older Star SG series printers, like the SG10 and SG10X, or the newer ones? I have two SG10Xs, and both have working quite nicely when I do printing directly through the STE. Ever seen it connected to a switchbox, shared between an STE and 486? That's my setup. No problems whatsoever. The newer ones shouldn't give you any problems.

Only problem is that I lost the spring in the tractor feed. There's a local crafts shop that has a package of these tiny springs.

Hi People,
I've just got a Tandberg 3260 Tapedrive, and was wondering if anyone knew of some decent GEM-based tape back-up software. I've got Tapebios, but it is a TTP, and I've never used a TTP for anything before and am a bit lost. I was able to test the unit with Tapebios's testing routine, and it all works fine...any ideas please contact via email rather than the group as I rarely get a chance to read the group stuff and as my newsreader only supports the last 100 messages I'd probably miss it...
Any help greatly appreciated and many thanks in advance...

Email the German docs to me, Johnny, I'll see if I can get you a better
translation. There's not much to it, as I recall - cut one trace or
desolder one pin, and piggyback the 74LS74 (or 4040) chip, then connect
it to a clock source at one side and the UART on the other.

1. There is a small CPX that changes the "video" between VGA and TV. This CPX called NVRAM.CPX (Boot Falcon/TT, Richard Kurz) Accesses the NVRAM.

2. If it doesn't work, well, I had to get a TV. set with a Vertical Hold Control (like Sony KV-1944R). For Pro applications there are boxes with a NTSC video (not RF) output.

With my iiyama 15 on a TT I have managed to correct the screen to a full
display, squared up nicely. On first starting up, I had a one-third
display and gradually used the controls to widen and reshape it, with
some trepidation that it might blow up or something? It hasn't - yet!
Do try to adjust the included "function" and "adjust" buttons with great
care: I'm sure you'll find it worth it.
Charles.

1205. English software/manual for J-Prommer

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-07 00:00:00 UTC
From: chrisc@zetnet.co.uk
Message-ID: <5ibmd6$6g4@irk.zetnet.co.uk>
Source record: 17296

Hi everyone...
Does anyone know if there is such a thing as an English manual or driver software for the Junior Prommer? A textfile would be good enough, even an FTP address for such a thing....Even better would be an English manual for Pinatubo, the aftermarket driver for it that could also handle the JP40 and JP44 device extenders.
Any help greatly appreciated, and many thanks for those that replied about the tapedrive...it's working fine now, I'm using Tapebios ....
Please reply via email, as my newsreader tends to miss a lot...

u> kOhm each. I don't know what these resistors are and what could I do to
u> avoid such problems. Can anybody tell me?

Don't worry about it. I've had a Star 9-pin and Star 24-pin printer before
now and never had a problem.

If you want to be sure that there's absolutely no risk, just turn the printer
on before you start your ST and don't switch it on and off while your ST is
still on.

: How come you can't change the name of the respective printer driver,
: even if its been copied? How does one use the changes? How come one
: has to completely reinstall NVDI if one wants to merely have an
: unfucked copy of the printer driver?

AFAIK, NVDI has two generic printer drivers: PAGEPRN.SYS and PINPRN.SYS. Since all page printers work pretty much the same, as do all dot matrix/bubble jet printers, this isn't unreasonable. I suspect that any "drivers" made in MAKEPRN are stored as different sets of codes in the generic drivers.

: Anybody make a driver for the Canon BJ-200ex?

There is a driver for the BJ10; I don't think the 200ex offers any extra features over the BJ10 (i.e., resolution is the same, page size is the same, etc.) so there isn't really any reason to make one.

1209. Falcon Fan Report

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-07 00:00:00 UTC
From: alkio@hkkk.fi
Message-ID: <5iaucs$5oq@ankka.csc.fi>
Source record: 17300

Hello,

Some of you might recall the Falcon fan thread a while back.

I just wanted to inform you that my Falcon _still_ works perfectly without the fan connected. I have the computer on for several hours a day and I disconnected the fan at least two months ago (if I recall right).

I am getting more and more convinced that the fan is not necessary in a basic Falcon...

It goes without saying that if you disconnect your fan and your Falcon for some reason breaks down it is not my responsibility. But I do recommend just cutting the fan wires if you dislike the noise...

Greetings, Jouni

>I need a "boot" disk with an OS to bring this thing up?

Only if it is a really old machine. It can take a while for the
desktop to appear if you do not insert a floppy.

>I have a few game disks but know OS or Utilities? Any additional
>would be helpful.

Try inserting the games disks one after the other and pressing reset.
If none of them do anything then either they are all corrupted or more
likely there is a hardware problem.

Dear Friends:

Having yes completed my installation of a used NOVA card, I still
have some questions, as the docs are all in german (please note
the lack of the sickening anti-deutch remarks I have seen in this
group...)

1. Is there an english version of the NOVA documentation? If so,
can anyone send me a copy?

2. Can anyone give me an idea of how to manipulate the NOVA
"Video Mode Generator?" or supply updated drivers for my
wonderful NEC M500 monitor? I am not using the video mode
generator becuase even my limited german indicates that
use of the Generator can damage the monitor(?)

3. Where there updated versions (I have version VME 8.17a) over
what I have (with updated drivers)?

As always, thanks and gratitude to those that respond!

The ST5660N does work, & it's supposed to be a SCSI2 drive.

I am not familiar with the 'NC' version.

Are the terminator resistors set correctly, how about parity?

From: sig@end.article
Message-ID: <sig-07049708221400001@47.85.0.99>
Source record: 17393

Hi

I'm not sure which is the correct group to ask, apologies if this is not it.

My request is for information on how to set up a terminal on the serial
line of an STFM running MiNT 1.12.5.

I have read the docs, installed KGMD, looked at more docs for MiNTOS, but
I still can't get a connection on the Modem1 port.

I have verified the serial port is working, I have ghostlink working with a PC.

I have been able to get a terminal working by using the 'okami' shell,
which has a built in terminal server, but I would rather use MiNT to do
this.

I have tried using 'getty', but the output appears in the shell window.

Is there a FAQ for this?

I own a Hades040. Almost all software I used on my old ST works on the Hades too (at a fabulous speed)! If somebody want a list of software I have tested please drop me an e-mail.

A list of working software tested on Hades you can find on:
http://www.ee.ethz.ch/~caschwan/medusa.html
http://www.carasys.de

> have heard rumors that the Direct and Hades doesn't implement DMA? What
Means, that there is no DMA-Sound and the programs only supporting DMA-Sound won't work. Stephan Wilhelm developed a high-end soundcard (STARTRACK) for the VME-Bus, but the only drawback is the price (~DM1000,-).
But a good idea would be to put a cheap soundblaster into the Hades and write a small sound-driver.

And I would recommend cutting the fan wires, get a new, quieter fan
and mount it above the PSU.

NEW INVENTION ALLOWS HUMANS TO LIVE FOREVER

If you disagree or disbelieve the content enclosed, please don't get upset. I am just publicizing my theory and my discovery based on my belief and observation. If you believe my report, or interested, please see my site http://home.earthlink.net/~alexycchiu

Press Release

ACCORDING TO ALEX CHIU, PEOPLE CAN STAY YOUNG AND LIVE FOREVER BY USING HIS NEW INVENTION 'THE ETERNAL LIFE RINGS' OR 'THE ETERNAL LIFE FOOT BRACES'. The Eternal Life Rings are rings to be worn on both small fingers of a user during sleep. The Eternal Life Foot Braces are to be worn on all fingers of both feet of a user during sleep. Both devices consist simply magnets and braces which hold magnets onto the fingers of the user.

Mr. Alex Chiu claims that the magnetic devices, the finger rings or the foot braces, both are believed to allow the user to stay young physically forever or to become younger! The inventor explained that the magnetic pole on the right small finger or on the right foot is opposite to the poles of the magnets on the left small finger or of the left foot. With a different pole on each side of the human body, blood circulation and electric current of the body are propelled. The speeded up blood circulation and electric current generate faster metabolism in order to fight aging process. The mentioned devices invented by Alex Chiu are believed to be able to alter aging or to keep the users young physically as long as the users wear them every night during sleep. The devices also cure many handicapnesses and deseases.

Mr.Alex Chiu is an inventor who is mainly specialized in effects on human health by magnetic forces. For interested party, please email alexycchiu@earthlink.net Check out my web site http://home.earthlink.net/~alexycchiu

Hi all!

Ok.. I need some info on upgrading a STFm to 1 meg!
I have a 1040 STe and know it has simm slots and is easily upgradable.
but have read.. but never really paid attention to upgrading a STFm!
What is all involved? I have 6 x 256k simms and it's a 1/2 meg machine!
Is there any way I could do it woth just soldering? Or is ther some kinda
board I have to get?

Thanks!
Johnny

1224. Atari TTM194 monitor and SVGA PC

Could someone explain how to connect an TTM194 Atari monitor on a SVGA PC ? I've heard that is difficult but possible. In fact, i want to know the schema for connecting the SUB-DB9 output of the TTM194 to the SUB-DB15 of my SVGA video card.

Many thanks for your help !

I don't think you can do much with just souldering, you'll need a board
to plug the SIMMS into, something like the Marpet Xtra Ram Deluxe board
should do the trick, over here they cost about 35 quid and you shouldn't
need to do much souldering atall but you need your Video Chip and MMU to
be socketed IIRC. Try one of the big Atari dealers still out there, I
bet Brad Coda has a few thousand under his bed or something.

From: nsouthon@acs.ryerson.ca
Message-ID: <5igm37$b13@ns2.ryerson.ca>
Source record: 17310

Hi all...while this isn't ATARI related, I have something to sell that I want to go to someone who'll USE them, as opposed to collect them or re-sell them.

The Vic and Intellivision are fine, and come with games. The C128 needs a bit of work. Interested?

nsouthon@acs.ryerson.ca

1228. ST to STe

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-09 00:00:00 UTC
From: A J Rakus <ajrakus@pop.a001.sprintmail.com>
Message-ID: <334C87EA.B45@pop.a001.sprintmail.com>
Source record: 17311

Wow! Can't believe this machine has this many users still! Now to my question:

I bought two Atari STs, many years ago. One is a 1040 STe. Most of my old games ran fine on the now-dead 520ST but will not run on the STe. Is there an updated TOS or TOS patch that will allow the older ST software to run on the STe?

My children are currently delighting in playing the original release of FTL's Dungeon Master, and I'd like to see that reaction much more as they discover all of Dad's other old favorites :-)

Thanx in advance for any guidance you can provide.

Tony

You can do it - but since it's the same amount of work for upgrading to
4 megs, and you can get four 1 meg SIMMs for about $20... Seems silly
to bother with 1 meg.

Same advice that was given earlier this week - go to any of the major
search engines and search for "Atari AND SIMMs" - it will turn up at
least one set of instructions, guaranteed.

Check out the FAQ that is posted every week to this newsgroup.

You need a SCSI adapter to connect a SCSI hard drive. There are several of
these around. The Link 2 or Link 96, or Top Link, whatever....

Then you need some driver software: HD Driver, AHDI, ICD Tools, etc...

In the last issue of the German "ST-INSIDE", there was a description of how to upgrade any ST to four meg simply using a 4 MB PS/2 Simm and some cable. Maybe someone could send you a scan and some instructions, I haven't got the time right now.

Sardy,

Schematics might be a problem, but the actual procedure is simple. You need a
SCSI host adapter that will connect to the DMA port; Norbert Wieczorek makes the
best one, the Link 96; you can find his home page at
<A HREF="http://members.aol.com/NorWiecz/index_e.html">
http://members.aol.com/NorWiecz/index_e.html</A>

There are others available. You will also need driver software; I would
recommend ordering HDdriver at the same time as the Link96; Norbert will bundle
it, and it is IMHO the best you can get.

> Tony

This might be a bit tricky! :^)
-There's a program called something like Make1Meg, which forces machines
with
more then 1 MB RAM to pretend to have only 1MB RAM. This was neccessary
for
some games which freeaked at the greater memory. Now, if you have a
stock
1040STe it will probably only have 1 MB RAM, so you're OK there.
-You have the TOS from your 520 ST(f, or m, or fm?)so you should be able
to do
one of the following: 1)make a TOS image of your 520ST TOS (but if
machine
is _totally_ dead - not likely) 2)pull the TOS from the dead
machine(probably
6 chips) and get a TOS switcher(see retailers on the www, or ask around
here)
so you can switch between TOS 1.04(?) and TOS 1.06(STe TOS)
-There is a possibility that you could run patches, but I can't think of
any that would apply to this situation. look for package3.arc whic has
almost
all the patches you would need for *any* Atari machine. There are
specific
STe machine patches.
-ask for !ynoT (Mr. STOSser).
bonne chance.good luck

I think the tos.h comes from TurboC/PureC and is therefore copyrighted.
Try to find any other libc (MiNTLib, Sozobon's libc...) on ftp and get
osbind.h, maybe tos.h. These should hold the defines.

For aes.h and vdi.h I would recommend you get the gemfast-library and take
aesfast.h, gemfast.h, aesbind.h and vdibind.h as replacements. They will
work, at least if you define the TurboC-compatibility macro before
including gemfast.h.

Sorry, this is just for the sources. To understand what the library
functions do you should get one of the popular hypertexts. Have a look on
ftp for subdirectories "info", "hypertext", ... Maybe somebody else can
point you out particular documents, I can't...

Ciao

Guido

1241. Re: NOVA VDI & NEC M500

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-11 00:00:00 UTC
From: prajoux@laas.fr
Message-ID: <5ilabc$6pg$1@laas.laas.fr>
Source record: 17324
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

I installed a NOVA VME PlusII 1 MB on August 96. It drives satisfactorily
a 17" color.

Since I made the installation several months ago, I do not remember
all the details, sorry. The memory I have of the installation is that
it is not intrinsically difficult. It becomes difficult because of
the language barrier. A good dictionnary is mandatory...

Here is what I can tell you.
Don't be afraid of using the Video Mode Generator. It is theoretically
true that you can damage your monitor if you sync it at a frequency which
is too high (although I would bet that recent monitors would simply not
accept to sync in this case). However, there is a safe procedure to
follow.
The VMG comes with a library of resolutions (.BIB file). Copy it in
a .BIB that will become your own library. Load the latter in the VMG.
It is possible under VMG to copy an existing resolution in a new one, and
then to edit its parameters. If you choose a resolution that you know
is suitable to your monitor, say 1024x768 at 70Hz or so, and make only
small variations in the parameters, there is no risk. It is possible
to ask the VMG to display the results of the current settings, which
it does by producing a rectangular grid. When you are happy, save the
resolution in your .BIB, adjust the monitor (especially the horizontal
vs vertical ratio) and exit the VMG.
Now, at the next reboot, intercept the MENU.PRG that you must have put
into the AUTO folder. It will display all the resolutions in the .BIB
file. Select your newly created resolution, save the choice and exit
MENU.PRG. You will get on your screen a superb desktop in the defined
resolution.
As soon as you become familiar with the VMG, use it to produce new
resolutions adapted to your needs and to your monitor. If you keep
the conservative attitude of modifying in relatively small amounts
each time, you won't break the monitor.

Hope this will help.
Regards.

From: Martin.Byttebier@ping.be
Message-ID: <860794458_OASIS_@ping.be>
Source record: 17329

Hello,

I checked my minixfs partition with fsck (-p N:).
I get the following message:

Couldn't sync or lock drive N:
Warning reboot after running
(Ignored) Pass 1 Checking All Inodes
Fatal error: Duplicate zones found when preening

What does this mean? Can this be repaired by tsck without loosing
data?

TIA
Martin

Just wondering
1) What is the size of the address space on the VME bus in MegaSTE
and TT030 computers?

2) What is the starting address and ending address for this memory space?

3) Are the VME starting and ending addresses the same in MegaSTE and TT030?

Regards
Jan

Won't work. You'll need a STE-aware TOS, otherwise it won't work at
all. And it's more likely that the games use the hardware in a way
that's incompatible with the STE.

Bought it MIDEX+ in 1992, runs here with a 4meg STE (NVDI
2.5,ICD-Link,44meg Syquest,Cubase2.0), has been with me ever since, do
also syncing to ADAT with it. Did soundtracks & productions with it.

Works very well. (some grounding probs, have to connect the SMTPE In&Out a
certain way, but that could just be me)

Specs:
4 MIDI outs (gives you a total of 5 outs (=80 MIDI channels) on the ST)
2 MIDI ins
SMPTE in
SMPTE out
4 Cartridge Slots

Best Regards

Jeffrey Fredrickson

Oh oh, you are touching a very sensible subject here ... OXO Concepts
doesn't exist anymore ... normally they are now called OXO Systems ...

They have a web page and e-mail ... but they don't answer since a few
weeks ... I'm aware of that because I'm very interested to buy their
Browser for which I have a demo ... you can download it at their home page :
http://www.oxo.ch/
their e-mail is/was? :
oxo@imaginet.fr

The last issue of the french ST Magazine supported them with a full
color page which was also talking about a new Falcon Clone called
EVOLUTION ... but if they don't answer to any query I don't know what
to think about ...

On the fr.comp. sys.atari ... some people said that OXO even didn't
exist anymore ... Also I have asked a question on this french usenet
about the use of Web Space and until now nobody never answered !!!!

It's really like an April joke, because I was continually talking to
them by e-mail just a few weeks ago ... who knows what's happening now
? Perhaps are they really out of work ? It should be a pity because of
the power and the speed of their Web Space ...

Try their demo !

Regards
Jo

****

TT: from $FF000000 to $FEFEFFFF, A24:D16, 16Mb
and from $FEFF0000 to $FEFFFFFF, A16:D16, 64Kb

Mega STE: from $A00000 to $DEFFFF, A24:D16, 4Mb
and from $DF0000 to $DFFFFF, A16:D16, 64Kb

Most of the VME cards are graphic boards. You musn't expect their
'video' ram to start at the beginning of the VME space, I've seen some cards
starting at $FC000000 on a TT or at $C00000 on a Mega STE.
Maybe it was to leave free space for RAM extensions, I don't know...
I have never seen any card using the 64Kb space (A16:D16), but a hard
emulator for C64 could be done, who wants to make it?

I've seen something like this when using fsck, I believe that all of my
files were recovered o.k.

I guess you don't have much choice, I don't know what else (besides fsck)
that can read/repair a minix partition.

Could anyone tell me how, if possible, to connect a vga colour monitor to an Atari ST?

Could you please send a copy of your reply by email

Thank you very much.

1263. A question about NOVA cards

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-14 00:00:00 UTC
From: prajoux@laas.fr
Message-ID: <5isvnnbah3@laas.laas.fr>
Source record: 17249

I have a NOVA VME PlusII 1 MB running satisfactorily on my MegaSTE-4. Until recently I happened to use only programs needing modest amounts of memory. Then, I started testing GEMVIEW, using JPEG images, and I got a "not enough memory" message. After de-activating my ramdisk, everything worked OK. However, I was curious about that and checked the amount of free memory, finding a figure much lower than expected. A call to SYSINFO showed me a screen memory of a little less than 800K, which is precisely what is needed for the 1024x768x256 resolution that I am using.

Question: Maybe I am naive, but knowing that there is a 1MB memory board on the NOVA card itself, is this system really eating up also a good chunk of main memory? What for?

I know almost nothing about NOVA hard+soft internals, so this really puzzles me.

Thanks for any information available.

Roland Prajoux (prajoux@laas.fr)

>
> Does anyone know how to set these so I can Daisy Chain both drive to work
> with each other at the same time?

Take the top off your Megafile 30, change the DIP switch settings to something other than the Megafile 20, they should be visible through a hole in the top centre on the metal screening.

But remember:

AHDI may not recognise the MF30 if its ID is not numbered directly after the MF20. So if your MF20 is ACSI unit 0, then you should make the MF30 unit 1. Try moving the far right DIP switch down in the MF30.

Reboot and it'll all work perfectly. (Yeah, right...)

Chris.

>Could anyone tell me how, if possible, to connect a vga colour monitor to
>an Atari ST?

All you can do is to connect the monochrome signal to a MULTISYNC VGA, because in most cases the monochrome vertical and horizontal frequencies fall within those the multisync can handle. In this case, you will have to build the cable yourself.

It is NOT possible to connect the color output because the corresponding frequencies are too LOW. (In the past it was possible to do so with some old multisyncs no longer manufactured).

Since I guess that you are interested in getting color, the answer is that you CANNOT do that directly.
An indirect solution is to buy a NOVA graphic card, a well-known add-on, to hook to your ST.

Regards.

the long and the short of it is:
No
I've tried backwards, STe_x, Falcon_x and Spectre GCR will not work
no cartridge port, eh!?

Source record: 17254

Hello there...

Anyone have a schematic for transforming a standard serial type mouse
(IBM) to the proper Atari configuration?

Sure would appreciate it, mice are getting hard to find in this part of
the country.

Please e-mail to...

John Casterlin
abraxas5@concentric.net

Thanx!

Everyone,

Sorry about posting my program to this and the other two Atari newsgroups. I have been living in a vacuum over here in the U.S. and I do not have much experience with the internet. I have been programming on my own over here since 1989 and I think I have quite a few good ideas for the Atari and MagiC. Also, I think I could help out with many GFA problems people have because I've had to figure many of them out for myself.

COULD ANYONE PLEASE tell me how to remove my BENCHTEST posts and tell me the CORRECT way to give my program out to anyone that's interested. Until I wrote this program, I had no idea, for example, which of my accessories was slowing down my computer and by how much. I could also see which area were slowed and which were accelerated...

Thanks,

Rob

1270. Hooking up 2 Megafiles!? Help!!

Newsgroup: comp.sys.atari.st.tech

Hi all!

Just got myself in a rut here and wondering if anyone can help me out?

I bought another used MegaFile30 to go with my OLD MegaFile20

My problem!

Well I want to chain the MegaFile30 to my MegaFile20 but don't know the proper dip pin settings! They come factory with all the dips switches in the up position...

Does anyone know how to set these so I can Daisy Chain both drive to work with each other at the same time?

My MegaFile20 is the boot drive and I want to make the MegaFile30 the slave drive..

I don't know if this info will change anything but I thought I'd better include it as it might complicate things..

I have modified my MegaFile20 (BooT Drive) and added another drive inside the case. So My MegaFile20 has 2 drive in it 20megs + 47meg = 67megs

I don't think it will change anything but thought I'd better include this just incase!

Thanks
Johnny

I was hoping someone could help me. I downloaded gemul8r classic (v3.6) from:

http://www.emulators.com

Does this program require special hardware (ie. gemul8r plug in card with TOS ROMs to work?) I tried running the gemul8r.exe under Windows 95 on my friends Pentium 133 (with 16 MB Ram). I have a TOS.IMG file for TOS 1.0 file that I put in the same directory as gemul8r.exe (although I don't think it found the file). Both these files were on his C:\ directory. When running gemul8r.exe from Windows 95, the program said it had found all his hard disk partitions. It also said it had found TOS ROMs on some port (he has no special hardware!). When I typed: GEM the program crashes. I tried e-mailing the people at emulators.com but they did not respond (yet). Can anyone help?
The Pentium my friend has is actually a Cyrex chip.

Do you already use DRVIN.PRG and ESCC.PRG in AUTO-Folder, because in
Hades040 works a ESCC-Chip for MODEM2.
If you still have problems with it, send me a PM and I'll try to help
you. (But I have no access to my emails until 25.04.97)

Posted and mailed.

Details of the project are at ftp://ftp.teleport.com/users/atari/multsync.faq

You must have a multisync monitor capable of handling 15.75 kHz horizontal to
use ST low and medium resolutions; ST high will work with a plain-vanilla VGA
monitor (sweep at 31.5 kHz).

>Further instructions are in the READ.ME and the program itself...
>
>I would love to see results from a Hades...

So would I. Here's the results from TOS2WIN_95 running on an IBM 350 - P100:

E�Bench v1.65 4.13.97

Add 2-byte 5.64 429%
Add 4-byte 5.49 446%
Multiply 2-byte 5.55 468%
Multiply 4-byte 8.88 335%
Scroll text 14.77 182%
Draw boxes 19.78 164%
Draw patterns 29.41 86%
VDI Copy 6.93 324%
String search 35.92 53%
Hard disk write 3.34 1332%
Hard disk read 1.79 1251%

Nice hard disk access rates, but otherwise, considering that we're usign a CPU
clock that's 12.5 times as fast as the original ST (1250%), it's rather
disappointing. Of course, the IBM-brand PCs are noticably slower than PC
clones running the same CPU clock.

The MF20 needs no changes.

You'll have to experiment a little. Start at one end of the DIP switch
and flip one switch; try to boot up and see what SCSI ID numbers show up
during the boot phase. If you don't see "Unit 1" then shut down, flip
that one back, and flip the one on the other end; try again.

Thanks - I tried wiring up the ST to a vga monitor last night hooking the two sync lines up & the ground pin & the monochrome pin to the RGB pin's on the monitor & grounding out the monochrome detect line. It booted in high res but the vga monitor wouldn't sync at all. This was with a mono vga monitor. I tried a colour vga monitor & this wouldn't sync either. I then tried a svga multisync monitor & this did sync but the left & right borders were *huge* & I couldn't compensate.

I've read the FAQ but still can't get it to work. Frustrating really because this seems to be such a simple task.

Just plug it in your serial port and get a serial mouse driver. There are
2 or 3 of these on your major FTP sites; check out:

http://www.umich.edu/~archive/atari/Utilities/Mouse/mouse25.lzh

Of course, no more modem connections ;-(

Some amiga mice have a little switch to become atari mice.

I am using routinely a home-made system which allows me to display both the color image of a NOVA card and the original monochrome image of my MegaSTE, on an SVGA multisync.

I had no problem in adjusting the monochrome image to its 640/400 aspect ratio, with near zero left and right borders.

So, I suppose that your problem is due to the actual capabilities of your monitor, whose adjustment ranges appear insufficient.

Regards.

There is definitely an english resource file, which I used with the german executable because the english one didn't work for some reason. I just renamed the english rsc to the name of the german one, and voila, english menus. Now, where to get it. I don't know. I used it at a former job and don't have a copy. Someone else must have it though.

Good luck

You could use any PC mouse in your serial port. If you have a STf or STe with one serial port then you have a problem since you wont be able to use a modem. I have a MegaSTE witch has 3 serial ports and im using a Genius PCmouse with the v25 serial port mouse driver. You can find it in every atari archive..

George...

I have just received news of Web Space from the graphic programmer of
it ... the commercial version seems to not yet being ready to sell but
they progress in the programming of the "PPP LINK" part of the program
.. the program soon should come ... let's hope it will be as soon as
possible because Oxo Systems have obviously money problems with old
customers of Oxo Concept ... some never received their broken Falcon
back since one year (sometimes more) ago.

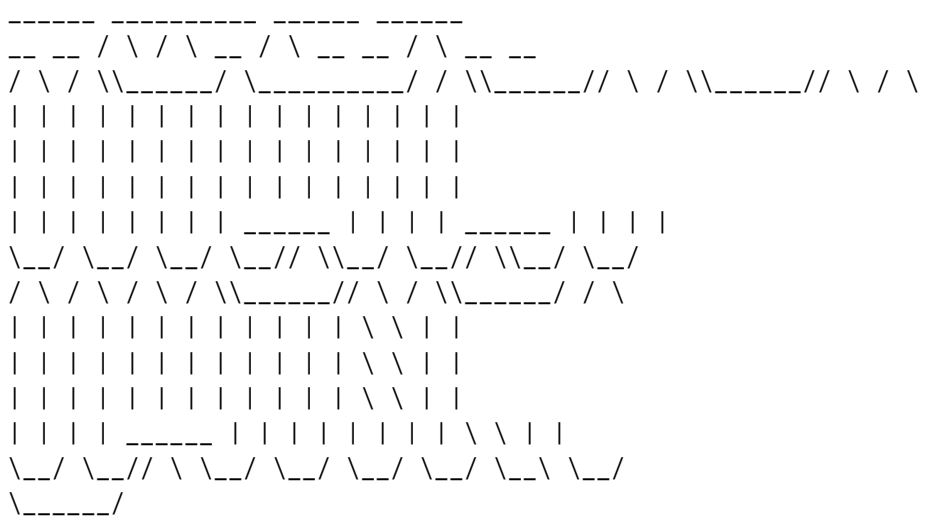
Thee Augean Stables Present:



The Atari Programmer's User Group

Despite saying some quite nice things about ICTARI, the web-site got something of a pasting from Atari Computing. In many ways, I cannot but agree. As an experiment I've had a go at putting the text from issue 45 on the web-site, 'should spice things up a bit. The picture of the "sad old Atari" will stay put for the time being. ICTARI 45 has some very interesting contribvtions, especially the ones about parallax scrolling in STOS and CAB / STiK. See for yourselves at:

http://www.elis.demon.co.uk/ictari/ictari.htm

See you at the Goodman's shows,

Have Fun,

"Augeas"

I've got one of these regular Amiga mice. This is a Megamouse, a CD32. But of course, it's for the Amigas, but I'd like to modify it for the ST. I've seen the inside of it.

I've tried different label printer programmes with my Lexmark 1020 which emulates HP500 without success. Any body if there is such programme? If not, what a great project for an aspiring programmer. I'm sure lots of Atari owners are unto Inkjets by now and could use it

I don't know if there is a ready working graphics card in the market
but information on how to connect an et4000 card to your Atari you can
find in ftp.funet.fi in docs catalog.There is a file about it (over 1
meg!!) that describes the task. I didnt read it so i can't say
anything about it.

Let's cut to the chase here.
It is a document. It is internal in the machine and a machine with a
homemade hardware hack in it is not exactly a high end selling point.
The mod. makes the midi switchable to a second serial port.
If you want a copy of it I will email it to you. It is on most of the
ftp sites I have been on that have a hardware directory.

Jared,

There is no reason to get a commercial driver to use the ZIP. AHDI will do fine.. but you have to get hold of AHDI Config. It will allow you to edit the ID-check parameter for AHDI at bootup. Let me know if you need the config program, and I'll send it too you..

Regards, Thomas

Thanks for the reply. I do have AHDI and the AHDI config program. It is recognizing the ZIP drive at startup, but it when I try to read a pre-formatted disk from desktop, the light flickers for a minute but nothing happens. When I try to format the disk with the AHDI utilities, it gets to the end of the process and an alert box appears saying 'Cannot Read Root...'. Any clue as to what's wrong? Thanks again.

The pre"formatted" Zip disks are actually prepartioned with one 100 meg
partition, using the PC's partitioning scheme. AHDI won't recognize that
correctly, and even if it would, you couldn't use this partition with
plain TOS as it uses more than 32768 clusters. You'll need BigDOS or
MagiC to be able to use the original PC partitioned zip disks.

I've never really used HDX, but it's a fact that a) HDX is quite
outdated, and b) no modern harddrives (and zip disks as well) need to be
formatted. You only have to partition them, but I don't know whether HDX
will let you do that without formatting them first ...

I really recommend you to get a decent modern harddisk driver. HDDriver,
which also supports some special features of the Zipdrive, doesn't cost
much more than two Zip disks (in Germany, at least). You can find a
demoversion at:

http://acp5.chemie.uni-kl.de/seimet/hddriver_english.html

or

ftp://acp5.chemie.uni-kl.de/pub/atari/

Ciao

Thomas

Dear Group,

Does anyone have this info? Or better a wiring diagram for an atari
520ST <-> Phillips CM8833?

I bought one dirt-cheap (monitor) recently for my sister with a cable
for the BBC Micro and resent having to pay a larger sum for the
connection.

I have the pinouts for the Atari (13 pin, audio and CV), but obviously
I need to know:

a) How many wires
b) Where they go on the monitor plug.

I also need to know if the plugs for the Atari end of the cable are
freely available as I'll have to source this.

Apologies if this is a FAQ (I've searched quite extensively)
Many thanks to you in advance,
David Carter.

Maybe you can try gluestik with the common cab-for-STiK overlay
instead of the mintnet overlay. Since I use gluestik I have far less
trouble whilst surfing. With my old mintnet overlay it was impossible
to visite for instance the homepage of Application System Heidelberg
with the graphics on. Now with Gluestik and cab.ovl 1.18 I can view
this page in all his glory.
Also I've found that the mintnet overlay couldn't handle numeric
addresses. Whenever I came across such an URL CAB displayed a
"Connecting to host" message and hanged there for ever.

I think (not sure) the cab-for-mintnet overlay is responsible for the
troubles you have.

Hope this help
Martin

Hello,

The main reason I wrote this program was to put together a list of all the results from as many different combinations of computers as I could. I am still looking for results from various Macs running MagiC, Falcon results, and the new Atari clones. This is the first version of the program that I have released and I understand that there is a bug in the hard drive read/write test. This is being worked on presently but I can't get it to crash on my TT, 68040 Mac, or my friend's 9500 PPC Mac. The other night, I finished a version that runs in ST LOW and is backwards compatible to TOS 1.0 yet still runs in all the other resolutions, MagiC, etc. The problem is that a couple of the tests had to be modified and may be off 5-10% with the first version on different computers. I appreciate anyone who takes the time to send me their results and I apologize once again for my binary to this newsgroup.

Email me with tests results and requests for newer versions...

thanks,

Rob Meyers

Basically other drivers should work as well. The only ZIP/JAZ drive
specific feature of HDDRIVER is that you can configure the password
based read/write protection features of the ZIP/JAZ drives.
Concerning AHDI and HDX you might have problems using modern drives
because HDX and AHDI are quite outdated and often can't cope with new
drives. Also keep in mind that AHDI is considerably slower with Falcon
SCSI than HDDRIVER. When reading short blocks (using SCSITOOL for the
speed test) HDDRIVER is 3 to 4 times faster than AHDI, With larger
blocks it's still about 30%.

Well, I finally got it working with AHDI 6.016 and HDX v5.?? . It
turned out that, seemingly, my CD-ROM was somehow interfering or the
software was having a problem with it. I swapped the ID of the CD-ROM
and the ZIP drive on the units and in the software so that the ZIP
was first in the chain. After that it partitioned correctly and everything
seems to be working fine at this point.

1321. Help with CAB/MiNT/PPP

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-19 00:00:00 UTC
From: jmirando@streport.com
Message-ID: <5j9i28$44s@lotho.delphi.com>
Source record: 17204

Sorry if this is duplicated folks, but NEWsie crashed on me and I can't tell if the first one actually got uploaded....

Okay folks, let's see if anyone can help me out with this...

I've been trying to get PPPKIT 1.4 to work on my MegaSTE with either CAB 1.5 or CAB 2 and have come up with a maddening problem.

It seems that something in PPPKIT (which is a MiNTnet setup, for anyone who doesn't know) doesn't like to write to my hard drive correctly. I can connect up to CompuServe (currently my only PPP provider) very nicely and can browse along quite happily except that something in the setup tends to write garbled files to my hard drive. Graphics are the most noticeable, since it's easy to pick out a munged picture. Whatever it is also seems to like to mess up FATs and directories, and on occasion, CAB will just hang there displaying "Connecting to Host" or waiting for another block of data to be received, and every so often I have to wipe the drive clean and start over. I had thought that it might have been that MiNTnet didn't like BGM partitions, so I reformatted my SyQuest to three partitons of GEM-compatible size and re-installed my software. Unfortunately, there was no change.

This is my system:

4 meg MegaSTE
TOS 2.06
881 Math CoProcessor
ICD LINK/ICD 6.2.0 Pro Utilities
Internal Seagate 240 meg HD (8 partitions)
SyQuest44 (3 partitions)
MINTNET folder on drive [K] (first Syquest partition)
CAB 1.5/2 with CabForMiNTnet overlay on drive [K]

Is it possible that MiNT doesn't like my ICD formatted Syquest?

I've corresponded with the author of PPPKIT, and he's at a loss. He says that he hasn't encountered this problem with his Falcon030 and can't think of anything that might cause these problems on a MegaSTE.

Are there any MiNT configurations in PPPKIT that might need to be changed for use on a MegaSTE? I _have_ changed MINTNP.PRG to MINT.PRG (that silly memory protection thing), but don't know enough about MiNT to have any other ideas...

How 'bout you?

Thanks in advance,

I've finally got my FX on my Falcon and my Falcon in a Tower (with the keyboard in a Freekeys), and now it seems the keyboard circuitry doesn't always recognize the keyboard. At times, I can have the keyboard totally disconnected and the system will not respond with the customary keyclicking. It also freezes a lot at boot. It seems to be less of a problem when I hook the keyboard directly to the motherboard, but it's not a lot better.

Any ideas?

Thanks,
Dan

I've heard word somewhere that the ICD hard disk driver works badly
with MiNT.
However I use exactly that combination!!!!
(With disk cache off.)

Looks pretty much like my system.
Though I don't use a math processor.

Silly memory protection?
Well this is a serious configuration problem!
The MiNT program file MUST be named 'MINTNP.PRG' on a 68000 machine!!!!
MINTNP means MiNT with No Protection !

You need at least a 68030 to run MiNT with memory protection.

The MegaFile has SCSI ID switches on a little red pad, marked 1,2,X. Mine
came switched 1 on, 2,X off, for SCSI 0, LUN 1(?).
Yours may require different settings, since it would still be SCSI 0, but
LUN#s 0&1. The slave unit would be SCSI 1, LUN#2. Unless, of course, the
LUN #s start at 1 instead of 0.

Joe

I'm using PPPKIT on a MegaSTe with TOS 2.06 and ICD 6.2.0 and can report no such problems here. I use MINTNP (I think this may be your difficulty) and CAB 1.41a to connect to Compuserve. If it will be of help I'll mail you my MINT.CNF. The only other possibility that comes to mind is that your Syquest cart is going flakey.

Dan

I've also got the cache turned off... another thing I'd like to get around, since the speed increase with the cache on is at least noticeable.

>Looks pretty much like my system.
>Though I don't use a math processor.

I don't even know why I went for the math-co, since I don't have any programs that make use of it... well, maybe some day. <g>

>Silly memory protection?
>Well this is a serious configuration problem!
>The MiNT program file MUST be named 'MINTNP.PRG' on a 68000 machine!!!!
>MINTNP means MiNT with No Protection !
>
>You need at least a 68030 to run MiNT with memory protection.

That is what I thought. But when I had so many problems running as MINTNP.PRG, I tried it without the memory protection (thinking that, perhaps, 'no protection' disabled the '030 portions) and have encountered no problems other than the ones I had before. I'll be changing it back to MINTNP as soon as I get this posted.

Thanks for your help. I'm sure that your suggestion along with others will help me out in short order.

Thanks again,

Martin,

I'll try GlueStik right away. I had tried it a while ago, but still used the cab-for-mint overlay. If I read your post correctly, the 'stock' CAB.OVL will work with guuestik... that's good news for everyone!

My biggest problem has been that I can't even visit the STReport website (I wanted to see what forms looked like). The only site I _haven't_ worried about visiting is my own (http://people.delphi.com/porthos) and that's only because I have all the files on disk!

Your suggestion, along with what others have told me, may put me on the fast-track to 'Surf City'. <g>

I'll let you know what I find out,

Conceivable. Did you format it AHDI compatible?

> I've corresponded with the author of PPPKIT, and he's at a loss. He

That won't do anything anyhow. Memory protection is onyl usable on an
030 or above (well, maybe an 020 - definitely NOT a 68000).

> How 'bout you?

I was getting some data corruption on my Falcon, but I deleted the cache
(from the desktop) and let CAB rebuild it, and have had no problems of
that sort since.

It may be useful to add the various paths from CAB's setting to your
MINT.CNF file, somewhat like this:

```
setenv PATH
,u:\bin,u:\etc,u:\usr\ucb,u:\c\,u:\d\,u:\d\cab15_ac,u:\d\cab15_ac\cache,u:\d\cab15_ac\html
,
```

(That's supposed to be all on one line, of course).

Good luck!

> Hard disk read 22.71 98%

Ehh... isn't this a bit strange? Isn't the test compared to
a TT _with_ NVDI? So a 16MHz 68000 MegaSTe is almost as fast as
a 32MHz 68030 TT and even faster in some tests????

I would better try Nembench. It's the only CPU benchtester I
would trust. Okey it doesn't test the performance when it
comes to screen output but if you only want to test the
CPU power it's the best there is. I do also belive that
the latest version does work on all TOS machines as the
DSP test is now a seperate program.

: Pentium 166 mmx w/32Mb ram Windows 95?
: Please Step By Step answer W/ programs to use on both machines and some
: advices about configs.

Easiest method:

- Get Ghostlink from any Atari FTP site
- Read the Ghostlink manual
- Set up Ghostlink using a null-modem cable

Tip: You can't run Ghostlink in the background on Windows '95.
And you may have to use the Atari Control Panel to set the
baudrate, coz' Ghostlink doesn't do this correctly on all systems.

Another Tip: You may want to get HSMODEM to speed up the serial connection
and reduce errors. It's available from most Atari FTP sites.
First try setting up without it.

There seems to be a bit confusion about MiNT and naming-conventions
here...

1. MINT.PRG will use memory-protection *if a 68030 with PMMU* is
available. On all other processors (Perhaps not the 040) it will
not use MP. So on a 68000 it doesn't matter what you call it.

2. MINTNP.PRG will disable MP on all processors. With FreeMiNT 1.14 on
a TT, virtual memory will be enabled as well (If a swap-partition
is available). With some bugfixing I suppose VM will work on any
030-computer.

3. MINTNM.PRG (FreeMiNT 1.14 only) will disable memory protection and
virtual memory.

Over the weekend I downloaded Pacifist. Having a whale of a time
reminiscing.....

Anyway, I booted up the old MEGA ST 2 and found that one of my partitions
is missing.
This is where *all* my source code for the Professional Virus Killer, Multi
Depacker and
numerous other utilities I wrote in the good old days.

Does anyone out there know if I can remove the drive from the Megafile and
plug it into my PC - I would assume the drive would be a SCSI but I would
like some confirmation on this.

Any help would be appreciated.

Mike Mee (aka MUG U.K)

If your talking about the 16Mhz cache on the MegaSTE, I used to have problems with it and my MiNT setup too. I seem to have cured them by turning the fastload bit off on all the programs and acc's that I use and making sure I boot without a disk in the floppy drive. Crashes and lockups are few and far between since I've done this.

I've now got gluestik set up and seemingly running properly. But now
whenever I attempt to access a URL, I get an error...

"pid 17 (CAB): ILLEGAL INSTRUCTION: User PC=D2F9E (basepage=1C4E60,
text=1C4F60)"

I've re-installed all of the components of CAB, including several
overlays (but not the CAB_4_MiNT 1.77 overlay), all with the same
results.

This is getting frustrating. And I thought being married was going
to be the big frustration in my life! <G>

I guess you just want to have file connects?

If so GHOSTLINK is the thing you want. The archive contains a slave program
for the PC. The main program, run on the ST, allows you to manipulate files
on the PC as if the PC filestore was a ST partition.

You should get 19k2 transfers on STe.

Thanks for posting your results. My program is not designed to be a
replacement for Gembench, but it did do what I expected on your machine.
The screen output tests are faster mainly because of running in
monochrome. I will compare your test results to my TT in ST HIGH and
post the results if you like. The 16Mhz just about doubled the
performance of my stock Mega which does the math tests at about 35% of
the TT. Also, my friend's TT/TOS 3.06 is slightly faster than my TOS
```

3.05 TT. Finally, the string search test shows how slow some operations are still going to be on the 68000. I wrote this program to test more than just raw CPU speed and Gembench couldn't give me that.

Rob, tireless GFA programmer

Well it wasn't me who had posted it, I just thought it looked a bit
suspect. But I guess it could be true.... :-)

Could this speed difference be because of the cache? the way caches work,
you wont (necessarily) get the same results every time. At least, thats
what the GEMbench manual says...

hehehe... now, if a MegaSTE can out-perform a TT (I dont believe it
either), what will your AB040 be like? :)

Magnus said *Nembench* not GEMbench. Nembench is written by Doug
Little and does accurate processor/memory tests (unlike GEMbench)
and includes a test for the DSP (so my 50Mhz DSP speed shows up in
tests rather than being ignored...)

>Rob, tireless GFA programmer

Um, how can you write an accurate speed-tester in GFA? The compiler
will be putting in a load of code which you really dont know about
which could affect the speed of tests...

Anthony

Works... but you cannot (IIRC) run programs from the ghostlink drive...

More complex method... (not recommended unless REALLY techy)

I have managed to fit MiNT-net et'al on a 1.4mbfloppy [using pack-ice, and
being very selective about what goes on the disk], and am currently trying
to set up a proper TCP/IP link between my PC and Falcon (win'95 has the
option to use TCP/IP for local communication over null-modem, so why not
use it? :)

Hopefully (although my link doesn't work yet) you can use standard net
applications (including NFS?)... if anyone has done this, could they
email me? cheers...

The problem with that (there's always one) is that it is a 'pure' test.
Nothing like any kind of application code you'd ever run into.

We really need a good _general_ benchmark program, IMHO.

I recently managed to link my 1040STF (1987 tos) to my pentium running linux using Mint-net & pppd over a null modem (3 wire) cable. I managed to fit enough to get nfs going on a 720K floppy. It works quite well (am able to execute programs that are nfs mounted from the pentium) but memory soon runs out with only 1M and transfer is a little slow at 19.2 kbaud.

I'm interested in trying to connect both machines together using MIDI ports as the pentium has a GUS card with Midi port. So far I've managed to cat files to /dev/midi00 on the pentium and read them from the midi device with Hisoft Basic (Time to buy another midi cable maybe). If anyone has done something similar could they please let me know how they went about it.

Rhys

This goes one better than Ghostlink, which allows a serial link from ST<->PC.

Ghostlink can run up to 115 Kbaud, if your ST can handle it, but you cannot (as yet) run ST programs from the PC harddrive.

This is a pity, because Ghostlink takes very little memory & does not need MiNT.

AFAIK, the author has not updated it for quite some time.

There are some other ST<->PC possibilities; the parallel port can transfer much faster. I have the instructions somewhere, but you need to make a special cable & AFAIK, the software is more like FTP than NFS.

How about upgrading your ST with HSMODEM drivers & the RSVE hardware modification. This should allow 57 Kbaud transfers. It would be faster than MIDI. If your ST has a CPU accelerator, it might be able to reach 115 Kbaud.

There is also the Ethernet option. It is supposed to connect to the ASCI port & (I guess) will transfer at 10 Mbits).

>Easiest method:
[Ghostlink]

Fastest method:

Get PARCP from any Atari FTP site. The current version is 2.02, and
it's able to connect a variety of PC's and ST's (Or ST<->ST) via the
printerports. It's much faster than Ghostlink, the only downside is
that the cable is a bit harder to make (More wires to solder.).

>Tip: You can't run Ghostlink in the background on Windows '95.

PARCP can run in the background on Win 95. It's also available for
Linux. The PARCP-server doesn't hog the CPU when idle either.

I've tried HSMODA07 (or something similar), but have yet to managed
better than 19.2 Kbaud although I have a sneaking suspicion that this may
have somthing to do with the Linux end of things (some 'setserial
/dev/ttyS1 -spd_hi' apparently). I was under the imperssion that MIDI ran
at 115Kbaud and had a proper UART (whatever that really means) in an ST
an should therefore be faster that most serial possibilites. I'm not too
keen to play with hardware mods in case I kill my ST.

: There is also the Ethernet option. It is supposed to connect to the ASCI
: port & (I guess) will transfer at 10 Mbits).
Do you have any more info on this option (I don't think my 1040STF
has an ASCI port)? I've just arrived at UNi with my ST to find a 'TP
RJ-45' network socket in my room - is this ST compatible or do I need to
give in and find some expensive PC type stuff to connect to it?

1362. Quick FAQ - v1.0 - Released

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-23 00:00:00 UTC
From: bales@garonne.stortek.com
Message-ID: <861799841.5337@dejanews.com>
Source record: 17048
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.st.announce

After checking that there were no major comments after I posted Draft v0.7
last week, I have finally converted the Quick FAQ to HTML and put it on
the web.

No big changes except the HTML conversion, and the removal of all the
machine specs that were taking up too much space for a 'Quick' FAQ.

It's currently on geocities in the US, so if anyone is interested in
mirroring it somewhere in Europe, please contact me.

So here's the URL:
http://www.geocities.com/MotorCity/2090/faq10.htm

Now, does anyone think I should still post the text version in c.s.a.s
every week or is that just a waste of bandwidth ?

Hmm.. I've a few more results which may be interesting.
no acc's loaded, just patches and xboot.
E�Bench v1.65 4.13.97
Falcon030 TOS4.04 16MHz mono noNVDI blitter
Add 2-byte 27.17 89%
Add 4-byte 27.68 88%
Multiply 2-byte 27.72 93%
Multiply 4-byte 33.86 88%
Scroll text 223.31 12%
Draw boxes 37.71 86%
Draw patterns 29.19 87%
VDI Copy 7.69 292%
String search 35.85 53%
Hard disk write CRASH
Hard disk read CRASH

E�Bench v1.65 4.13.97
Falcon030 TOS4.04 16MHz mono NVDI
Add 2-byte 35.54 68%
Add 4-byte 35.54 68%
Multiply 2-byte 36.73 70%
Multiply 4-byte 41.83 71%
Scroll text 26.12 103%
Draw boxes 25.29 128%
Draw patterns 19.88 127%
VDI Copy 12.33 182%
String search 35.88 53%
Hard disk write CRASH
Hard disk read CRASH

the hard disk crash is because I should have had the program
running from c:\ instead of e:\e_bench
what I find interesting is that, all things being equal, AND
assuming the program will reproduce these reults when run again,
is that with NVDI loaded, my 2 and 4-byte numbers are lower - a
result of the calculations NVDI is making when it is running?

and VDI copy is _slower_ with NVDI than without.
Not what I would expect. :^)

1366. ADVERTISE TO OVER 100 MILLION PEOPLE FOR FREE!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-23 00:00:00 UTC
From: nejeh@gdi.net
Message-ID: <5jm9t9$65g@news.gdi.net>
Source record: 17052

Please take the time out to read this email. it is worth your time.

ADVERTISE TO OVER 100 MILLION PEOPLE FOR FREE!!!
Or send a message to millions of people...

NOW YOU CAN ADVERTISE FREE AND GET DRAMATICALLY
MORE RESPONSES THAN ADVERTISING ON NATIONAL TELEVISION

With E-mail your potential customer is forced to read at least the
headline of your letter. Unlike TV, magazines, newspaper ads, and
direct mail where more than 99.99% of the recipients will skip right
over your advertisement.

TURNS YOUR COMPUTER INTO A CASH REGISTER: Conservative estimates indicate
well over 100 MILLION people will have E-mail accounts in the next year!
E-Mail Blaster turns your computer into a cash register by giving you FREE,
immediate access to all of them. Do you think some of the more than 100
million people with E-mail addresses would be interested in your products or
services? Even if you don't have your own products or services you can
still make money buy promoting our computer software!!!
You can make money with our new software called E-MAIL BLASTER

Here's how:
* By Using E-Mail To Sell Your Products & Services
* By Using E-Mail To Sell our Computer Software such as: Email Blaster, Web Walker,
Email Lock Box etc.
* By Renting or Selling Your E-mail Addresses
* By Becoming A Distributor for e-mail BLASTER

MUCH FASTER: With bulk E-mail you get responses back in 1 to 4
days instead of waiting weeks or months like with television or print
advertising. You can begin filling orders the same day you send E-mail.

FREE ADVERTISING WORTH MILLIONS: It costs millions of dollars to mail out
millions of letters using the United States Postal Service! Now you can
send your ad to MILLIONS of people for FREE using E-Mail BLASTER

E-MAIL BLASTER IS ACTUALLY 3 PROGRAMS IN 1: E-Mail Blaster is amazing new
technology and the most advanced bulk E-mail software on the market today.
(1) E-Mail BLASTER automatically extracts E-mail addresses from America
Online, CompuServe, Prodigy, and the other online services, the Internet,
web pages, news groups, and hundreds of other sources. (2) E-Mail BLASTER
automatically stores the E-mail addresses in your computer along with
keywords that describe hobbies and interests to created highly targeted
E-mail addresses. (3) E-Mail BLASTER sends your marketing letter or ad to
MILLIONS of targeted E-mail addresses at the push of a single button!

HOW DOES E-MAIL BLASTER WORK? E-Mail Blaster has dozens of special filters to automatically harvest E-mail addresses from major online services such as: America OnLine, Compuserve, Delphi, Genie, and of course the internet.

AOL AUTO EXTRACTOR: E-Mail Blaster has many special features like the AOL Auto Extractor that let's you use a regular dial-up Internet connection to collect names and addresses from America Online. Collect America Online addresses without being a member. Allows you to download names and addresses from America Online without paying membership fees or online charges. Auto Extractor for all of the online services and Special E-mail database search engines will also be available at no additional charge.

SIMPLE TO USE: E-Mail Blaster does all the work for you. Unlike other programs where you must cut & paste addresses, E-Mail Blaster does it for you automatically. And, unlike other E-mail programs, with E-Mail Blaster there is no need to purchase any additional software

SPEED: Your time is important. E-MAIL Blaster is DRAMATICALLY FASTER at extracting and sending E-mails than all the other programs on the market that we tested it against.

NO SPECIAL EQUIPMENT NEEDED: E-Mail Blaster runs on a PC with Windows 3.xx Windows 95, Windows NT, a 386 or faster processor, 4 MB RAM, and a hard drive with at least 10 MB free and your own SLIP or PPP connection. No other software needed. Also runs on a Macintosh with Soft Windows installed.

****
This message was sent using E-Mail Blaster.

E-Mail Blaster is The World's Leading Bulk E-mail software.
With E-Mail Blaster you can advertise to over 100 million people for FREE!

Cost: We are giving away Email Blaster your only cost is $165.00 License fee.

THAT'S IT!!!

Our company is in the software business of developing cutting edge products, so we know if you have the opportunity to use our software FREE you will be our future customers. We know we need you to make our software business a true success!

Hummphh.. I guess your are right, but I still prefer a good mips
counter before a poor benchmark program wich say that a 68040
is slower than a 68030. :-)

> We really need a good _general_ benchmark program, IMHO.

So what are you waiting for? A fast c-hack shouldn't be to hard
for you. Maybe you can use some of that GEM-DEU code you have done.
Doesn't it already have a 'test' mode of some sort? Just loading
a GIF image wouldn't be to bad either and then applicate a bumpmap
filter on the image. :-)

But as Johan pointed out to me they used different video modes, but it
realy shouldn't differ that much from mono and 16 colours. About the
AB040 don't ask. I know Johan got a bit upset when he did the test.
Not very cool at all. :-)

$)CHi!
my name is Saung-mun Park and now living in Seoul Korea.
I write this letter in order to get your assistance and help.
I am running the trade company, and now thinking the project to extend the
business into memory chips and semiconductors.
But I am caught by the difficult things.
Those problem is that I am shortage of technology and knowledge, because
of my majoring economics in university.
Therefore I am searching for anyone or any company providing technology
and knowledge to our company in order to develop China and Korea mareket
on the base of our joint venture.
We will welcome anyone who want to extend the business into China or Korea
in collaboration with our company.
I think that It is effective to develop china market on the base of Korea.
the joint venture's filed is on the base of semiconductor and memory chips
to sell the communication
machinery and products.
I think the following methods to develop the market.
first, establish the Korea based corporation which is invested together.
and then collect the selling companies in China.
In order to prepare the affairs or situation which may be occurred in the
future, we may be good to establish corporation in Korea.
and if you have the corporation in Korea, we get the information of
products come from Japan Taiwan American and Europe in order to provide the
cheapest and qualified goods to China market in compare with establishing
corporation in China.
I think we must import goods and parts from these countries and then
assemble or process them , and at final stage, export them to China.
if you are interested in my suggestion or want to get more information to
my suggestion, please contact me.
I will send you the details.
Thanks for your interest and sincere.

Take the cover out and move the wires around the horizontal
section (around the flyback); you're trying to find loosen connections.
Also, check for cold solder points/burned areas in both surfaces of the
printed circuit board. Phil.

I recently bought an Atari SC1435 stereo monitor and for a while it worked fine and then one day the screen went blank when in use.
It now makes a quiet humming noise, not like an earth hum, it is higher in pitch.Someone suggested that it might be the flyback transformer.
Any suggestions ? Or perhaps there is a FAQ on this monitor somewhere ?

Thanks

<...>

I own a Megafile 30 and a Megafile 60, and there's no SCSI in them.
I'm not sure, I think Atari hard drives are similar to that old PC
standard (Shugart or something, I just can't remember...), and the
ACSI software is similar to SCSI, but not identical.
I'd suggest you try to resurrect your lost partition with Uwe Seimet's
DISKUS. It saved my life a hundred times!
A warning: DISKUS is a powerful program; if you're not technically
gifted, leave the task to a friend/technician/wizard. I would be
happy to help you, but I live in Switzerland... 8-/

You need to do a hardware modification.

The easy version just uses one chip, you get up to 38400 baud.

The other version gets you up to 115 Kbaud, but it's more complicated.

You still need HSMODEM to use the extra speeds, & with HSMODEM on it's own you will still only have 19200 baud max.

I was under the imperssion that MIDI ran
> at 115Kbaud and had a proper UART (whatever that really means) in an ST
> an should therefore be faster that most serial possibilites. I'm not too
> keen to play with hardware mods in case I kill my ST.

Midi is 31250 baud, & does have it's own UART (= serial controller chip).
>
> : There is also the Ethernet option. It is supposed to connect to the ASCI
> : port & (I guess) will transfer at 10 Mbits).
> Do you have any more info on this option (I don't think my 1040STF

> RJ-45' network socket in my room - is this ST compatible or do I need to
> give in and find some expensive PC type stuff to connect to it?

The ASCI port (called hard disk port also) should be the same on the STF, STFM & STE. A guy called Norbert Wieczorek is developing an ethernet interface for the ST. Details at:-

http://members.aol.com/NorWiecz/index_e.html

If this is not what you want, there are other options, but they involve a lot of hacking & expense, unfortunatly.

Hmm... thats interesting... can you execute programs off mounted drives?
at what stage in the boot-up can the link-up be established? does it
work with Falcons and MiNT?

Aloha,
I'm thinking of getting an STe/TT emulator for my Pentium Pro
200mhz system. I'd like opinions on which emulator to go for...
It'll be a loong time before I retire my ACTUAL Atari FAlcon 030,
but my new PC at home needs quality GEM software bad! So far, the
PC products I've installed for windows are junk compared to the Atari
stuff...half the features...but you get nice dummy wizards and lots of
colors! I was pricing DTP packages the other day...and would you believe
that the closest I could come to Page Stream or Calamus for Windows 95 was
Page Maker or Quark of the $600 price range!?!
Okay, here's what I wanna run on the Pentium...
Page Stream
Image Copy
True Image/Paint
Atari Works
Some kind of TCP/IP stack and CAB (To complement IE and NetScape)
Possibly KCS Omega Level II, the only sequencer I have with no dongle
Sample C (SDS MIDI Sample Dump/Converter/Librarian)

Thanks,
Brian

From what I've understood (but then I've only read the docs), ParcP doesn't actually mount the PC drive like in Ghostlink. It has a sort of text line FTP-like interface to do the file transfers without a GEM interface, so it isn't as transparent as Ghostlink.

The ideal program would of course be a mix of Ghostlink (desktop integration) and ParcP (speed), plus the ability to run programs from the mounted drive, but I'm afraid that's asking for too much.

I would just like to mention that Monochrome is WAY faster than 16 color mode. In monochrome, there is only 1 bitplane, screen memory can be shifted byte for byte. In 16 color mode, there are 4 bitplanes and unless you are moving screen memory in even 8 pixel increments, the VDI routine has a lot of calculation to do.

Do the math:

320x200x16 colors = 32000 bytes

640x400x2 colors (mono) = 32000 bytes

640x480x16 colors = 153600 bytes

1280x960x2 colors (mono) = 153600 bytes

Of course a 32k screen will update faster on a MegaSTE than a 153k screen will on a computer that is NOT 4 TIMES faster...

It would be nice to clear some smoke and figure out what "faster" really means. I certainly don't have all the answers but I wrote this program to try and figure some of them out. I just received some Falcon results recently and the machine ran some tests 40% faster just because they ran without any ACCs! I try to dig a little deeper into things and see how they work before I write off results as being bogus.

just my thoughts...

Yes, but would just doing multiplications/additons without graphics
output cause such a huge difference? Normally you doesn't output alot
of stuff to the screen while doing the calculations like
packing/unpacking loading etc. or am I wrong?

This is what MiNTnet should provide - although unless it is possible to get the
PLIP drivers to work with Win95 (I doubt it) it wont be as fast as ParcP, but
it would be more transparent than ghostlink, run programs, and allow funky things
like telnet as well as nfs...

The problem is setting it up to work with Windoze...

I will continue (ok, 'start') to support Tiberius Software when they
write something which interests me :-)

How about an uptodate midi file player for drag and drop operations
which can be used as an acc on single tos and can be used as a helper
program for CAB and is GEM'd and compatible across the range?

P.S. I grabbed the Fawlty Towers demo from the Tiberius web page... not
sure when I will get the time to try it, though.

I use two Falcons, but i don't have CAF.
Xero-X cant take some file from the second falcon over a romport interface..
The Software is MidiCom, always nice for a serial transfer.
Ask Dieter_Cotta@KR.maus.de for romport interfaces.

So i have a transferrate of 160Kb/sec between both machines.

> IS there any software using the LAN conector?

MidiCom..
Ask Harald_Blees@KR.maus.de, that's the best way to get the latest info.

Quantum SCSI drives are undoubtly the best, I have already used 4 of them
and the last one is the TRB850S inside my TT, also I have a friend who
is using the same TRB850S with his Falcon ...
Seagate drives are not so reliable I think ... you may encounter
little more problems ...

Hello,

I have just got a C-lab Falcon II. I have connected an external SCSI hardisk, which is properly terminated, to the Falcon. However, since I do not have an internal 2.5" SCSI harddisk, I am wondering if I need an internal SCSI terminator.

However, when I run my Cubase audio Falcon, I just got the message "SCSI error 2" when I play back the audio file just recorded.

Any ideas? Please help and send email directly to me. Thanks.

hmm no, Mint itself is not a problem with icd. The real problem will
be MINIX filesystem. ICD is not a ahdi compatible driver.
Magic and icd? I don't know. Could be ok. but still ICD has a lot of
lacks compared to a good hddriver for instance.

There is Graphic Converter for the Mac and it handles CVG into EPS etc
but not back the other way. It is shareware and can be found on most
Mac sites, including MacWorld. Not sure if there is a PC version tho'.

Quantums are excellent - probably better than Seagate (except in
durabiltiy, I've only ever had 1 Seagate die, and it was replaced under
warrantee), and almost as good as WD.

I would take it - the Falcon should handle it easily.

This drive will work fine. BTW, there is no limitation concerning the
SCSI drives you can connect to your Falcon. Like the TT the Falcon has a
standard SCSI port and this means that any SCSI or SCSI-2 drive works.

1406. GhostScript and SLM printers

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-28 00:00:00 UTC
From: Domagoj Cosic <domagoj@cs.tu-berlin.de>
Message-ID: <5k1v3jkeb1@news.cs.tu-berlin.de>
Source record: 17090

Hello!

Some time ago I decided to intstall GhostScript on my old TT, in order to use the attached SLM605 laser printer in connection with a PC. PostScript seems the only way to use Atari laser printer with a PC. However, the SLM printer driver provided with GhostScript distribution for Atari seems to be very ancient (I consulted the sources). It relies on the Diablo emulator just to print a bit image. The result is disappointing, as the margins are not correct, and moreover, the lower border of the page gets cut.

However, there are certainly more direct and reliable ways to control the printer. I have discovered some neat assembler routines in the German ST-Magazin a few years ago, and I am curious if somebody did implement them in connection with Atari GhostScript. I would do it myself, but the only way to do it is to install the complete GNU development environment on ATARI, which I am trying to avoid. Can anybody point me to an usefull source of information. I would be very grateful.

Thanks in advance.

Regards,

Domagoj Cosic

No, it isn't public domain. Just like much of the great ST programs, GFA is
still commercial, but not supported. To copy it would be piracy and is
illegal.

>> > > * Is it still commercial and where can i get it and how ?

You'll probably have to find a second hand copy somewhere.

>

A small word of advice! BE EXTREMELY CAREFULL!!! even when the monitor
is switched off there is still very high voltages in there! Shocking! Isn't
it :) (SORRY). Seriously if you do not know what you are looking for DO NOT
consider tinkering with the innards of a monitor. You may risk a serious
electric shock.

Bye! Brian.

Are pinouts available for the SC1224 RGB monitor? I'm referencing the round female DIN 13 pin connector on the back. I have purchased a used SC1224 with no documentation.

Any help would be appreciated!

Easy. Take a look at:

http://www.teleport.com/~atari/STinternals.htm#MONITORPORT

This is the Monitor port seen from the ST side.

[Article crossposted from comp.sys.atari.st]
[Author was Steven N. Hirsch]
[Posted on 29 Apr 1997 11:17:17 GMT]

All,

It would be humorous if it weren't so frustrating! The Atari ST FAQ spends a lot of time pontificating about the evils of system-software piracy, then provides absolutely ZERO information about where one can legally obtain TOS.

Having just spent two days on the Web searching for:

(1) An older TOS version that can boot my 1040ST from diskette

and/or

(2) Latest-and-greatest TOS (2.06?) ROMS for internal upgrade (yes, I'm handy with circuit-level electronics and have the instructions..)

I'm about ready to throw in the towel..

Can someone please provide me with a US (or, possibly, Canadian) source which can legally SELL me the required items?

If it is not possible to obtain these legally, I'd appreciate E-Mail contact regarding other avenues. I will only pirate them if I cannot purchase them, so no flames, please!

Thanks in advance for any pointers.

Steve

1415. MiNT under Magic!?!?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-29 00:00:00 UTC
From: jacquesa@cs.man.ac.uk
Message-ID: <5k4mgv$pep@m1.cs.man.ac.uk>
Source record: 17149

Well, I'm gob-smacked....

Why did nobody ever say that you can run MiNT under Magic? Last night I accidentally enabled MiNT on the second time around the boot sequence of Magic, and it booted. However, as I hadn't selected an AES it used the 'ROM AES', but of course instead got the Magic AES, complete with its speed increase.

Interestingly, MiNT takes over the process management / scheduling, and also provides its XFS/XDD's (I had ramfs.xfs and minix.xfs installed, and both appeared to be working!)

I didn't leave the system running for long as the reason my drive (with minix partition) was connected to their machine was to try and recover data from it, so I didn't want to risk anything... So, I have no idea about how stable this system is, but I see no reason (since minix.xfs works) why it isn't possible for Magic users to install MiNT and MiNTnet on their systems.

Admittedly, they could just install MiNT anyway, but if they like the Magic AES, and dont have another fast replacement AES then this is perhaps a good way to go....

Has anyone used such a system for more than 2 minutes, and can tell us if it is stable / fast etc.?

Anthony

From: 3heiden@rzdspc74.informatik.uni-hamburg.de
Message-ID: <5k4h1c$a8o$1@rzsun02.rrz.uni-hamburg.de>
Source record: 17150

: Does anyone have any information on the Panther video card.

The Panther is an adaptor for ET4000(W32) and one other
Videocard (different GAL-sets needed) to the 68000'er DIL 64 socket.
You need NVDI ET4000 (for ET4000-cards) to use it (optional availbale).
You can get it at 'mw electronics, Koenigswinter/Germany'.
The Hardware is a DIL64 adapator card with a 50cm cable to an isa
Interface card, so you can place your video card in an optimal
position in your computer.

I have a Panther in my Mega ST 12MHz/Pak/Frak and it is running
stable.

I have a Mega STe mother-board, i have questions please
answer me, because i want take advantage of the board..

what type of HDD's for Mega STe can i use? internal,
external,removable-media..
what type.? : need special connector? (prices)
Exist IDE adapter for Mega STe?

Can I connect a ET4000 with Crazy Dot to Mega STe??
how cost Crazy Dot ?
how cost ET4000 ?

what monitor i need if i can connect Crazy Dot & ET4000 to Mega STe??
what monitor? with some special connector?
Is Nova Graphics card a good choice?

exist differents types of cases for Mega STe..??
what type desktop? tower? (prices) ..what case i need if a want connect
ET4000 & Crazy Dot to Mega STe Motherboard??

what languages & kits exists for Mega STe to programming??(prices)
(like C++,C,java,perl,databases..)

I know that megaste motherboard came with TOS 2.05..then the question
is ...which are the differences between it and TOS 2.6.???

I hear that megaste have keyboard input..... what type of keyboard
....an "atari-keyboard" or "PC-keyboard"?? (what is the cost of each)

Can I up the speed of Mste ??? (16Mhz to 32Mhz)

Thanks very much to anyone that answer my questions. Good Bye Friend./

PS: Sorry for my english./

>what type of HDD's for Mega STe can i use? internal,
>external,removable-media..
>what type.? : need special connector? (prices)

Any SCSI HDD will works ... no special connector inside, though you
must have the SCSI HD card interface to connect one inside. The
external must be a ACSI one though I see you don't have any case for
the moment ... then you can use the inner SCSI connector (... on the
SCSI interface card if you can find one). You can also buy an external
SCSI adaptor like LINK II or so.

>Exist IDE adapter for Mega STe?

I don't think so. Or perhaps available in Germany, but not easy to
find.

>Can I connect a ET4000 with Crazy Dot to Mega STe??

Without any problem. I have used one with my Mega STE during two
years, it's now in my TT030.

>how cost Crazy Dot ?

You'll only find second hand one at very good prices like $100/150 for
the Crazy Dots 1 (256 colors) and more expansive for the Crazy dots 2
model which support thousand colors.

>what monitor i need if i can connect Crazy Dot & ET4000 to Mega STe??
>what monitor? with some special connector?

No special connector and every VGA/SVGA screen will goes !

>Is Nova Graphics card a good choice?

Yes, but more expansive ... and more colors ... you can yet find some
models in the shops.

>exist differents types of cases for Mega STe..??
>what type desktop? tower? (prices) ..what case i need if a want connect
>ET4000 & Crazy Dot to Mega STe Motherboard??

Even with a Crazy Dots VME card you only need the genuine atari case
available from Best Electronics ... ask Bradley for the price !
You can also put your mothercard in a tower, but you must chose a big
one because the mother card is bigger than any PC ! a lot of work, but
possible ...

I hope someone will answer to your other questions.

Regards
Jo

1422. Question about atari ST, cubase, video

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-29 00:00:00 UTC
From: d.wilkinson@qmw.ac.uk
Message-ID: <d.wilkinson-ya023580002904971658040001@news.qmw.ac.uk>
Source record: 17156

A friend has asked me the following -:

He's using an Atari for music using cubase but the video refreshes twice
each time making things slow.
He's thinking about getting some software graphics accelerator but doesn't
know if that will solve the probelem or have any effect at all.
I know this is a litle vague but I was a little tipsey when he asked me and
as he hasn't access to the net he's asked for my/newsgroup advice.

Sorry I don't have any more facts.

BTW I'm a mac person so i know little of Atari.

Please email if possible as I'll probably forget to get back to this group
be for the posting expires..

Thanks dave <d.wilkinson@qmw.ac.uk>

1424. Problems with MagiX 4

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-30 00:00:00 UTC
From: dwmoar@aol.com
Message-ID: <19970430022201.WAA26830@ladder01.news.aol.com>
Source record: 17158

I am running a MegaST4 - Conner 1.06 gig hard drive - IO Mega ZIP drive - NEC CD Rom - ICD LinkII - and ICD'S Pro Boot software. The problem that I am having is that Magic does install and goes through its reboot process. The desktop comes up and than a error message appears at the bottom of the screen with usally two to three bombs. The message says something about a stack overflow. I have removed just about everything from the auto folder and all the accessories from the root directory thinking that this might be the cause of the problem. NO LUCK still does the same thing 2 -3 bombs and says STACK OVERFLOW. I have went as far as installing MagiX4 on my MegaSTe and have the same results. Could this be result of the ICD Pro boot software? this and the Link II is the only commom thing I can see that I have between the two machines. I could use any and all the help that I can get. Thanks in advance for the help.

dwmoar@aol.com

1425. Hardware problem with SM124

Newsgroup: comp.sys.atari.st.tech
Date: 1997-04-30 00:00:00 UTC
From: Hans-Peter Nollert <nollert@tat.physik.uni-tuebingen.de>
Message-ID: <33674953.794B@tat.physik.uni-tuebingen.de>
Source record: 17159

Hi,

I have a strange problem with my SM124 monitor (the Manifacturing Date is
September 1989):

If it has been turned off for a long time (several days or more), and I turn it on, nothing happens. Not even the LED turns on. However, after sitting like this for a couple of minutes, the LED starts flickering, and
finally lights up continuously. The monitor now works normally. If it's turned off for less than a day, it starts immediately without any problem.

I seem to remember reading about a similar problem a while ago. I think a
certain capacitor in the power supply was blamed at the time, but I don't
remember which one. I haven't saved those posts, though, since they didn't
concern me directly. In the FAQ, I couldn't find anything about this, either.
(There wouldn't be an FAQ for troubleshooting / technical repairs somewhere?)

All help is appreciated!

Hans-Peter

Well many thanks to all who replied to my previous postings, lots of software has been sold though there are still a few packages and hardware items remaining. Rather than put prices on them, if there is anything that interests you then make me a sensible offer and ... it could be yours!

Software (all registered with manuals where appropriate):

Fontkit plus 3
Script wordprocessor (MacWrite clone - uses signum fonts)
Textstyle (produces bitmaps from vector fonts!)
Vector X-change (converting between vector formats)
X-boot (ultimate bootup prog)
Addrese (address gem prog - very nice) - registered
2-in-1 (manages all compression utils in a shell)
Gemspool (printer spooler) - registered
NVDI3 100-font pack (TTF high quality typefaces on 5 disks)
Everest editor (registered)
Gemview (registered)

CD's
Bingo (german PD/shareware etc)
Gemini archive of michigan
Suzy B's double CD treasure archives!

Hardware etc
Vidi 12 ST colour digitiser for ataris
SCSI external CD rom driver (apple mac - needs a scsi connection)
Hama trilock digital genlock unit (suitable for any computer inc. pc's etc.), new
Titan graffiti STE genlock unit

Regards,
Simon

You would be best off buying an external Atari floppy case (354 - SSDD;
314 - DSDD) with cable and power supply, and simply swapping the
floppy disk drive contained inside. Atari used Shugart standard drives
in all but their earliest efforts and it is a simple matter to unplug
the old drive and plug in the new.

Two things to watch out for: PC floppy drives are configured to "1",
while Atari floppy drives have to be set to "0"; the ribbon cable
connector may sometimes appear "upside down" in relation to a standard
PC setup - if the floppy drive light stays on all the time, the 34-pin
connector is in upside down and should be reversed.

Hope this helps,

Randy Kwak

The STOS extension EXTRA has become Public Domain. It was announced (between friends!) at the Atari Show in London on April 27th 1997. Get your copy from Goodmans PDL or Floppyshop PDL. It has been posted to the newsgroup alt.binaries.atari and will soon be available from http://www.airtime.co.uk/users/sinbad/download.htm

Source record: 17165

Hi!

Why not try Parcp 2.04 ?? I use it here between a ST and PC
using the printer port. You don't need any hardware modifications if
your PC has an EPP printer port (if not a little hardware is needed).

The cable is the same as for ST-trans (1:1 with pin 1 and 11 crossed)
if your PC has EPP and it's very fast (sometimes over 33000 cps here
with my 16 Mhz ST/386DX40).

It works under Linux, OS/2 (you can access HPFS from your ST), Win95
and normal MSDOS (and i use it on my Atari with Magic). The interface
is raw (commandline) but very good to use!

Most today PC's can turn EPP on using the Bios, sometimes older ones
needs a jumper switch. My PC has an E-IDE ISA multi i/o card with
an ECP/EPP (you must use EPP!) so in my situation a jumper is moved
and i placed a second printer port in my case to connect the printer to.

PARCP204.LZH [2] PARCP 2.04beta - fast parallel copier.
Works between two computers on their
parallel ports. Supported are Atari
(TOS/MiNT/MagiC) and IBM (DOS/Linux/
OS/2 and Windows95).
News: little bugfixes

The latest version is available from:

E-mail: stehlik@cas3.zlin.vutbr.cz
FTP: ftp.zlin.vutbr.cz/pub/atari/parcp/parcp*lzh
(usually also ftp.cnam.fr/pub/Atari/Telecomm/parcp*lzh)

If you have seen Parcp working (and it does work!) then you trash
all older programms like Ghostlink, Midi networks etc... It does
also support LONG filenames!!!

It's still a master / slave situation (like Interlink) and you are
not able to run programms from the remote drives but maybe that will
ever change in the future, i don't miss it.

Greetings,
Koos

Re: ATARI 1040 ST-fm First Word Plus Help Request

Dear Atari Folks,

I'm trying to help an older gentleman who invested in an
Atari machine for word processing many years ago.

I need your help to find information about how to "export"
several large, important documents from First Word Plus (the
word processor) on the

Atari 1040 ST - fm (platform)

to any DOS or Windows MS Word, Wordperfect or ASCII format.

If you cannot advise, I may have to *print* the documents
and then scan them with OCR! I'm hoping you may have a
better, more straightforward solution?? Please?

Thank you, in advance, for any advice you may supply.

Pax,
Dave Kinnaman <kinnaman@Immune.Com> 512/463-9321

1436. Problems with scsi on mega st 1

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-01 00:00:00 UTC
From: mjr@geo.uni-bonn.de
Message-ID: <5k9mhq$umo@news.rhrz.uni-bonn.de>
Source record: 17170

--

Hi, i have problems to get some of my disk drives working with a mega st 1:
It works nicely with original atari drives (sh 205 and megafile 30) but does
not recognize at all my two scsi based drives, a syquest 44 MB with icd host
adaptor and a fujitsu m2614 s with a GE-SOFT host adaptor. The latter works
flawlessly over many years as the main drive of my other system, a mega st 4.

The mega 1 has been upgraded to 4 MB with a piggypack set.
I remember that the ST 1s had DMA problems but don't remember details (it needed
a patch to boot with original atari drives, didn't it?).
Does someone know what's necessary to make such an st 1 work with the ics
adaptor --- the megafiles are not very interesting for me because i wanna run
the machines with linux/68k (both boxes run with 68030 cards).

Please respond by email, because i don't have the time to read this group
regularly any more.

Thanks for any help

Michael

yea, but you can boot a Falcon into 640x240x2 colour mode. :-) Thats 16k,
and so should be easier on the bus, and simple plotting. :)

>AB040 don't ask. I know Johan got a bit upset when he did the test.
>Not very cool at all. :-)

Hehehe... maybe the percentage is the wrong way round? ie. it says the
MegaSTE is 10% of the speed of an AB040, rather than the AB040 being
10% speed of MegaSTE... :)

I guess you mean MGIF? I dont think Johan has put his GIF decoding
or image processing into GEM-DEU... :-)

BTW Johan, did you ever finish that multi-mode line drawing code
for GEM-DEU? As there is some activity, maybe I should include
it. :)

Hi there,

MagiC 4 and now MagiC5 works fine on the mega ste 4 i have I use the
HDDriver though.

It gives no problem on the TT. A friend uses CBHD and MagiC works
fine on his Mega STe4 I would suspect the ICD Drivers

I have other things to do.
I try to help out as best I can, though.

>>for you. Maybe you can use some of that GEM-DEU code you have done.
>>Doesn't it already have a 'test' mode of some sort? Just loading

If you mean MGIF, it does indeed time all its operations. IIRC, you only
need to supply the -dbg flag to get the results (among lots of other
debugging info) written to the standard output.

>>a GIF image wouldn't be to bad either and then applicate a bumpmap
>>filter on the image. :-)

The timings for the GIF loading are even split into load and decode phases,
so you'll get the harddrive tested as well. ;-)

That bumpmap filter is hardly very general processing. It spends most of
its time multiplying numbers and calculating integer square roots.
It also has the complication of being based on GPLed code, which means that
anything that uses it will also be covered by the GPL.

(The GNU General Public License requires that full sources are available
if asked for. This has always been the case with MGIF, but most people
seem to prefer to keep their sources to themselves, unfortunately.)

>I guess you mean MGIF? I dont think Johan has put his GIF decoding
>or image processing into GEM-DEU... :-)

No, but at least a GIF loader would be useful to replace textures.

>BTW Johan, did you ever finish that multi-mode line drawing code

It was finished (apart from the VDI support) before my machine died.
I'll still have to put that VDI stuff in there, though.

>for GEM-DEU? As there is some activity, maybe I should include
>it?

You mean you've got your harddrives to work again?
(Or am I confusing you with someone else?)

Brian Roland (bjr@Edison.EbiCom.Net) wrote:

: I'm thinking of getting an STe/TT emulator for my Pentium Pro
: 200mhz system. I'd like opinions on which emulator to go for...

Try downloading the demo versions:

GEMulator: http://www.emulators.com (You'll need the MagiC PC OS file)
MagiC PC: http://members.aol.com/ashinfo/ashftp.htm (German Page)
TOS2WIN: http://www.comex-sales.com/www/dutch/products/tos2win.htm (Dutch page)

: It'll be a loong time before I retire my ACTUAL Atari FAlcon 030,
: but my new PC at home needs quality GEM software bad! So far, the
: PC products I've installed for windows are junk compared to the Atari
: stuff...half the features...but you get nice dummy wizards and lots of
: colors!

And lots of HD space and RAM and a crap GUI :-) Yeah, I know what you mean...

: Image Copy

For a PC alternative to Image Copy, try FTP'ing the DOS package DISP somewhere. It's a _very_ versatile Image viewer/converter program, and it's fast and has a text window user interface (which is not as crap as it sounds)

: True Image/Paint

There are some nice shareware PC paint/image processing programs too, like PSP (which has a horrible user interface though...)

: Some kind of TCP/IP stack and CAB (To complement IE and NetScape)

Get Linux :-)

d>
d> I don't think so. Or perhaps available in Germany, but not easy to
d> find.
Here in the UK, The Upgrade Shop showed an IDE adaptor running in an STe at
the recent Atari shows.

I'd assume that it would also fit a MegaSTe (but not yet an STFM).

Speak to 'ya later!

1450. Hardware problem with SM124

Newsgroup: comp.sys.atari.st.tech

Hi nollert@tat.physik.uni-tuebingen.de, on 02 May 97 you wrote:

n> If it has been turned off for a long time (several days or more), and
n> I turn it on, nothing happens. Not even the LED turns on. However,
n> after sitting like this for a couple of minutes, the LED starts
n> flickering, and
n> finally lights up continuously. The monitor now works normally. If
n> it's turned off for less than a day, it starts immediately without
n> any problem.

Could be a solder joint which has crystalised. It would be worth
examining the PCB and re-making any joint which is not bright and continuous.

There is a RF choke (looks a bit like a resistor) in the base circuit of the
switching transistor. I have known these to go intermittent giving the
symptoms you mention. There is no real need to be fussy about its
replacement, a simple wire will do. It is only there to meet US RF radiation
requirements.

n> I seem to remember reading about a similar problem a while ago. I
n> think a
n> certain capacitor in the power supply was blamed at the time, but I
n> don't
n> remember which one.

It COULD be a capacitor but, when these go, you usually get a short to earth
and a blown fuse. While you are examining for dry-joints look to see if there
has been leakage around any of the big capacitors and replace if you are at
all suspicious.

Hello
256k SIMM's for sale, suitable for upgrading a 512k STe to 1024k. £3 for the pair and I only have 2 pairs.
Replies in U.K only please.
Write a cheque made payable to Kevin Jones for £3 and your name and address, if I don't have any SIMM's left I will destroy the cheque unless you state otherwise.

```
Send to:
Mr K Jones
26 Broughton Ave,
Lowton,
Nr Warrington
WA3 2PR
```

I also have an ATARI STFM for sale too for £25 with software all leads, fully working and with 1mb RAM. Must collect yourself though.

Is there anyone who needs some files which may have been on past ST Format
disks?
email me and I will see if I have the files, I will only send files which
are shareware, freeware or pd at no charge and I will not send full games
as I am not a pirate so don't bother asking.
I also have lots of cheats for games and some files.

I have some items that I've come accross that I'd like to get rid of.
I am NOT getting out of Atari, just thinning my stock :) Most of these
items I bought at one time, and they have sat unused for the majority of
the time, or I have picked them up when purchasing complete atari systems
at once time or another. Everything listed works, and has been tested -
unless otherwise stated. thank you.....

Item : Futures Systems (Indus) 3.5" floppy drive
Model : GTS-100
Type : External double sided disk drive
Cond. : NEW
Quant : 1
Notes : LED Display, Full black case, includes power supply and original
Notes : box. These types of drives work exellently
Asking: $50 + Shipping

Item : Mono Monitor
Model : SM124
Type : Atari Monitor
Cond. : Great
Quant : 2
Notes : Includes Original box and Power Cable
Asking: $50 + shipping OR TRADE FOR SC1224

Item : Complete External Hard drive setup
Host Type: ICD Link
Mech Type: Rodime
Megabytes: ~44mb formated
Type Case: "Atari" shoebox
Condition: Good
Quantity : 1
Comments : Includes DMA cable, and Power cord. This is complete setup!
Comments : Plug 'n Play deal. This is a cheap way to get a complete hard
Comments : drive setup!
Comments : If you need more room, you can easily pull the Rodime mech
Comments : and put in something bigger!
Asking : $100 + shipping

[-][-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-][-][-]
M I S C
[-][-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-][-][-]

Item : Hard Drive Case
Comments: I have a very nice 'plus impulse' hard drive case (2 drive
cap. plus power supply, cooling fan, etc. These sold via a
local dealer here for $80 each) The drives sit side by side.

And it's made out of STEEL/METAL not this plastic crap you see
nowdays :) includes power cord

Item : External NEC-25 CD-ROM
Comments: I do not have the power cord for this. But I can give you
the specs on the power supply (as I have another with the
power supply) so that you can get/find one.

Item : LAZER 'adapter' box. I can't remember what these are called.
Comments: But they are the boxes that plug into the computer
and the lazer printer plugs into this box. Comes with the
Lazer printer cord. And 1 DMA cable (as it's built into the
box) This box also has a DMA pass-threw. (I heard these were
selling for $60)

Item : MFM hard drive. ST-251 formated to 65mb or so.
Comments: requires controller card (IE Adaptec 4070) and host adapter.
I know the drive works, but I fried the AdSCSI plus host and
the Adaptec 4070 a couple of weeks ago :(

Item : 5 (?) MFM hard drive mechs.
Comments: I don't know what works, and what doesn't. They all did work
when I put them in the box, but I cannot test them at this
point.

Item : VideoKey
Comments: Allows you to hookup 2 monitor's at once and switch between
them via 1 button. (I saw these selling for $25)

And there is still more stuff that I am uncovering. The prices mentioned
in this MISC area are what I've seen them sell for. They are NOT set
prices. Feel free to make me an offer.

Asking: Lets talk!

Does anyone know? They were the last place still making games for the ST,or one of the last.They made STario Land,Alien Thing,Brenarvious and others.They used to advertise in ST Format,right up until the end.I tried contacting them by mail but I never got a response,I'm not sure if it's because I didn't order anything or if they're gone.I really want to get that Nethack/Gauntlet hybrid they were selling called "Arnorath",that sounded so cool! Anyone know anything about this game or this place?

Shocker 2 and all the Hintzen, Verwohlt games were among the best,if you liked Oxyd then this is what you want.Don't mind that it's 1997 and these games came out in 1993-94,that's irrelevant.Just get Shocker 2! The only drawback is it runs in Monochrome only,but the gameplay has such incredible depth that you wont care after a few levels. Just use a mono emulator if you have a color monitor.
I just thought I would enter this into peoples consciousnesses (sp?) because I truly appreciate gifted,creative game designers like these guys.And with all the crap that roars down the pike these days on all computer platforms we need all the help we can get.

Show these guys that they matter,order their games please! No,I am not affiliated with them in any way.You can tell because I am not writing in broken English :) . And yes,I do own a PC,and play all the newest titles on thePC,N64, Playstation and Saturn regularly,my neighbor reviews them for a magazine and gets free copies all the time,I get them from him when he has an extra.It's mostly all technically astounding crap,it really makes me sad sometimes,what a waste of technology.(Mario 64 is kind of cool,though.Just *kind of*)

Lets keep all these great game creators encouraged! It's worth it!

>> : > terminator.

Hi Malcolm,

If it is a MKII, then the termination on the motherboard has been removed
in order to fit the internal SCSI cabling. If you have removed the drive
but not replaced the terminator packs onto the board, then you will have to
do so, or have it done by a service tech. There are two or three 220 OHM
single in line resistor packs, I think 8 pin. The header connection has to
be desoldered and the packs resoldered in.

Our tech department has this info if you need it, or you can send the
machine to us for Certified C-Lab Service.

All the best,
Chris @ Computer Direct

E-Mail Your Way To Riches!

Dear Friend,

We all know E-mail is here to stay. It's fun, easy and exciting! Would you be interested if we could show you a way to make well over $1,000 per week doing it?

This is not a joke. You may have seen many people trying to tell you that you can make money by joining this or that scheme! Guess what, you decide to go for it and then you get nothing but frustration and disappointment! We are here to take your frustration and disappointment into an Electrifying Adventure!

We have been marketing on-line for almost 2 years now! We have never spent one red penny on advertising and made nothing but profits. We can show you how to make money every day of the year. Many people may think this is untrue or it just can't be done. We are here to tell you that it is absolutely not true. The biggest mistake people make about marketing on-line is that they sit and wait for people to contact them. You will never make it if this is your approach and we'll tell you why. There are over 60 MILLION people on-line right now, and seven new people logging on every minute of the day world-wide and everyone is offering something. So how do you get a potential client or a new customer before your competition does? The answer is simply " Creative E-mailing" and it WORKS! I'll tell you why. You're taking your product, service or idea directly to the market instead of waiting for the market to come to you!

Here are a few testimonials we'd like to share with you (They're all 100% TRUE!):

Internet Communications, my wife and I owe you so much. We ordered your Creative E-mail System and within the first week we received over $1,150 in orders for my Internet Consulting business!
--Charles -- California

I have bought two so-called E-mail programs that cost me over $600.00 when I received them. They were extremely difficult to operate and it took me about two weeks to figure them out. Once I did, they were so time consuming it just wasn't worth my time. When I received your course it took me about four minutes to install and I was in business! Within the first 24 hours of my first E-mailing I received over $580.00 in sales over the phone. That first week I grossed over $2,000.00! I really can't believe how easy you made this, anyone can do it! Thanks!
--Dennis -- Illinios

Hello, I'm a divorced mother of two children. I wanted to thank you for helping me out. This was my first time buying anything on the Internet. I was skeptical at first but I figured I'd take a chance. This was the best chance I've ever took! My part-time business is now a full-time home-business, thanks to your

Creative E-mail System. I had to hire my two family members to help me out!
This is GREAT, thanks so much! I'd recommend this for anyone!
--Ellen -- Florida

You may have seen other people offering products "E-mail Programs, E-mail Addresses, Extractors, Etc." The vast majority of these products are very over-priced and very difficult to even use. None of them even supply you with current, up-to-date, FRESH & RESPONSIVE E-mail addresses! Our Creative E-mail System puts everything into one package to make your profits soar immediately! Even if you do not have a product or service to offer, we are going to give you over 500 how-to reports that you will have full reprint rights to! What makes our course different from anything else being offered anywhere is that we're dedicated to your success! We do not succeed unless you succeed! All of our E-mail Address Databases are created in house. We do not trade our databases with anyone because people are selling extremely bad lists on the Internet. Many of other people's databases are filled with duplicate addresses and many of them are undeliverable. We keep our own database so we know exactly what we have and we keep nothing but the best. There's no other way. We believe in producing high quality products that should be priced reasonably for your success! Read on to see the special bonuses you will receive.

******** SPECIAL 10 DAY BONUS ********

If you order within the next 10 days we will include:

1) 500 How-To Reports (You may resell these at any price)

2) Your Personal Complete Guide To The Internet -- This 175 page e-book covers every single aspect of the internet. You will never have to buy another internet book! When you complete this book, you will know more about the internet than 90% of the people online right now.

3) When you purchase our 8 MILLION SUPER responsive E-mail list we will include Mega-Mailer. It sends 250,000 E-mails per hour! All other orders will receive Pegasus Mail. It mails about 30,000 per hour.

Here's how to get the Creative E-Mail System:

All orders are delivered on CD-ROM or 100mb Zip Disk (Iomega).

============> E-Mail Databases <================

2 Million FRESH E-mail Addresses only $ 99.95
4 Million FRESH E-mail Addresses only $179.95
6 Million FRESH E-mail Addresses only $249.95
8 Million FRESH E-mail Addresses only $299.95

You will be sending your Marketing Letter to 2, 4, 6 or 8 MILLION People! To mail to 2 MILLION People by U.S. Mail at $.32 per stamp would cost $640,000.00, not including envelopes or paper! The price of 2 MILLION E-mail Addresses isn't even a fraction of the cost. And the great thing is that if you have 10 products, you can E-mail to your list as many times as you want to! Your profits will never stop soaring! Don't pay someone else to send your

advertisement out, do it yourself and save big money! The average cost right now to send your ad one time to ONE MILLION people is $1,400.00. You can send it 100 times to EIGHT MILLION people for only $299.95 and that includes Mega-Mailer that sends 250,000 per hour!

==========> Order Form <==========

E-Mail Your Way To Riches!

Dear Friend,

We all know E-mail is here to stay. It's fun, easy and exciting! Would you be interested if we could show you a way to make well over $1,000 per week doing it?

This is not a joke. You may have seen many people trying to tell you that you can make money by joining this or that scheme! Guess what, you decide to go for it and then you get nothing but frustration and disappointment! We are here to take your frustration and disappointment into an Electrifying Adventure!

We have been marketing on-line for almost 2 years now! We have never spent one red penny on advertising and made nothing but profits. We can show you how to make money every day of the year. Many people may think this is untrue or it just can't be done. We are here to tell you that it is absolutely not true. The biggest mistake people make about marketing on-line is that they sit and wait for people to contact them. You will never make it if this is your approach and we'll tell you why. There are over 60 MILLION people on-line right now, and seven new people logging on every minute of the day world-wide and everyone is offering something. So how do you get a potential client or a new customer before your competition does? The answer is simply " Creative E-mailing" and it WORKS! I'll tell you why. You're taking your product, service or idea directly to the market instead of waiting for the market to come to you!

Here are a few testimonials we'd like to share with you (They're all 100% TRUE!):

Internet Communications, my wife and I owe you so much. We ordered your Creative E-mail System and within the first week we received over $1,150 in orders for my Internet Consulting business!
--Charles -- California

I have bought two so-called E-mail programs that cost me over $600.00 when I received them. They were extremely difficult to operate and it took me about two weeks to figure them out. Once I did, they were so time consuming it just wasn't worth my time. When I received your course it took me about four minutes to install and I was in business! Within the first 24 hours of my first E-mailing I received over $580.00 in sales over the phone. That first week I grossed over $2,000.00! I really can't believe how easy you made this, anyone can do it! Thanks!
--Dennis -- Illinios

Hello, I'm a divorced mother of two children. I wanted to thank you for helping me out. This was my first time buying anything on the Internet. I was skeptical at first but I figured I'd take a chance. This was the best chance I've ever took! My part-time business is now a full-time home-business, thanks to your

Creative E-mail System. I had to hire my two family members to help me out!
This is GREAT, thanks so much! I'd recommend this for anyone!
--Ellen -- Florida

You may have seen other people offering products "E-mail Programs, E-mail Addresses, Extractors, Etc." The vast majority of these products are very over-priced and very difficult to even use. None of them even supply you with current, up-to-date, FRESH & RESPONSIVE E-mail addresses! Our Creative E-mail System puts everything into one package to make your profits soar immediately! Even if you do not have a product or service to offer, we are going to give you over 500 how-to reports that you will have full reprint rights to! What makes our course different from anything else being offered anywhere is that we're dedicated to your success! We do not succeed unless you succeed! All of our E-mail Address Databases are created in house. We do not trade our databases with anyone because people are selling extremely bad lists on the Internet. Hi
I've got an Atari STe and an Atari Megafile 30 hard disk.
I think that I don't have the proper driver. The STe will move files around on the hard drive, but won't run software when it's connected.
Does anyone know where I could find a copy of the Hard Disk Driver that will let me use the Megafile disk with the STe?
Thanks
Martin

1472. Urgent - Gemulator problem

OK, I've now spent more than week faffing around testing Gemulator and have reached the following conclusion:
++
With Gemulator using MagiC 4 or 5 16 colour display is NOT possible.
****

Before I print this "fact" in the review can anyone prove me wrong!?

I can get 16 colours with TOS no problem. No matter what I try with MagiC 4 and 5 I get either mono (at various resolutions) or ST-medium, or garbage, but nothing else.

I've tried every setup option, every version of CHGRES I can get my hands on (it's completely ignored AFAIKT - can anyone confirm this?), different NEWDESK.INF files and all the other tricks I've used over the years, all to no avail.

I haven't got a copy of MagiC 2 so can't test that but frankly Gemulator either supports MagiC or it doesn't, users can't be expected to downgrade. Has anyone got a Geneva setup up and running in 16 colours?

Print date is looming fast now so if _anyone_ can prove me wrong or help I'd like to know ASAP I really want to finish this review and it's driving me crazy!

Joe

1474. Zip drive on C-Lab Falcon MkII

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-06 00:00:00 UTC
From: escher@netcomuk.co.uk
Message-ID: <336ee321.1679380@nntp.netcomuk.co.uk>
Source record: 17109

I'm hoping some of the technically-minded might be able to assist with my Zip drive problem - I'm really clueless!

My Falcon MkII has a Quantum Daytona 540Mb SCSI HD (Internal) which is recognised by ICD Pro as SCSI ID 8 (LU 0-zero). The drive doesn't appear to have any way of changing the SCSI ID, and I don't quite understand how ICD determines SCSI ID 8.

However, as soon as I attach the Zip via the SCSI cable and reboot, ICD recognises the Zip drive (as SCSI ID 13) but then goes on to recognise the hard drive as "QUAATT DAYTONN 5444", in other words attaching the Zip appears to scramble the Falcon's display. Once the desktop appears, all the icon titles are scrambled and I can't run any programs.

I have tried changing the termination of the Zip to Off and On, and likewise changing the SCSI ID from 5 to 6, but no joy.

The disk in the Zip is PC-formatted, so I've tried putting BigDos in the Auto folder in case this is the problem, but still no luck.

As you might expect, the manual that came with the Falcon is the standard Atari one, with about half a page about SCSI drives, and is next to useless.

Please, can somebody tell me what I'm doing wrong?

TIA,

Jim

> understand how ICD determines SCSI ID 8.
Erm, that's SCSI ID 0. If ICD Pro reports that as 8, it's the DMA ID used
for extended Rwabs()-calls. This ID is 0 - 7 for SCSI devices 0 - 7 on the
ACSI-bus, 8 - 15 for SCSI devices 0 - 7 on the TT's or Falcon's SCSI bus
and 16/17 for IDE drives 0/1.

> However, as soon as I attach the Zip via the SCSI cable and reboot,
> ICD recognises the Zip drive (as SCSI ID 13) but then goes on to
> recognise the hard drive as "QUAATT DAYTONN 5444", in other words

> programs.
Well, I don't know the MkII, but as it has an internal SCSI drive, it
must either have had an removable terminator on the external SCSI
connector before you connected the Zip, or it has an internal SCSI
terminator which has to be removed before attaching external SCSI devices.

If it has an internal terminator, and you didn't disable it before
connecting your Zip, this /could/ explain the problems you're experiencing.

Hope that helps ...

Ciao

Thomas

AFAIK, the C-Lab Falcon Mk II did have internal SCSI rather than IDE due to
its extra speed. I could be wrong, but...

It is very important that only the last device in the SCSI chain is
terminated so if the ZIP drive is the last device it must have
termination ON and the harddrive must have the termination off.
I have a ZIP drive in my falcon and it works.

I hope this will help you.

I'm very pleased to ascertain the enthousiasm for my first announcement
about the ultimate list for atari programs available to download from
web pages ...

Please, go to see by yourself what is becomed this page ... it's
growing up from day to day and I'm only waiting for people who don't
yet have send me their program to put on ... english programmers are
certainly not the least ... far away from that ...

So if you have developped any kind of program for the atari platform,
don't hesitate anymore to communicate the following data ... I will
put them as fast as possible on the page (within two days ...)

Program NAME.
Author NAME (you, little genius ...)
The URL ADDRESS from where we can download this (these) little marvel.

Thank you to everyone who has sent datas about programs ... even if
they have not developped themselve the program ... they have found it
somewhere in the gigantic web ...
thank you for your continuous collaboration ...

How, let's go futher, this list must become THE ULTIMATE ATARI PROGRAM
LIST available on the web.

>>>>>>>>>>>>http://www.ping.be/~pin10575/PRG-IND.HTM<<<<<<<<<<<<<

Sincerely
Jo

Some boxes are empty in the table board ... if you know what to put inside,
be cool, send the missing data to me ....

Bye

I don't use ICD with any SCSI devices myself. But, I would imagine
that it determines this ID because the system actually recognizes 0-7 as
ACSI devices and 8-15 as SCSI. So your hard drive is actually SCSI
device 0 and the ZIP drive is SCSI device 5.

>However, as soon as I attach the Zip via the SCSI cable and reboot,

>

I had a similar problem with my CD-ROM and my ZIP drive. It sounds
like that maybe the hard drive is terminated. Try removing the
terminator on the hard drive and activating the ZIP one.

Source record: 17120
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings..

I want to use a PC hard drive (Jaz) on my Falcon for backup, and then backup offline to SCSI DAT on my 486-33. This would allow me to keep making music while doing backups/archives. Could someone help me understand more about how this is done?

I understand I need a utility called Bigdos, and I also know I need version 6 of Bigdos for use with the Falcon. Great.. but how exactly does it work? Do I need to repartition any drive I want to have recognized on the PC using Bigdos (I have HDDRIVER version 5.XX)? Are there any problems moving data from a drive that was partitioned using Bigdos to one that wasn't on the same SCSI chain? Is a Bigdos partition compatible with Cubase Audio Falcon?

Where can I get a copy of Bigdos 6? Uwe only has version 8 on his web site from what I could see.

Finally, does anyone know of a reason why a backup to SCSI DAT and subsequent restore would not work when transferred to the Falcon? Obviously the backup software will only be PC based, I realize I'll always need a PC for restore, but other than that?

Any answers will be appreciated.

-Mark

Hi,
I have a MegaST using AHDI 4.02, and I copied the desktop.inf file
from the root directory into a subdir, and now my ST will not boot.
The ADHI 4.02 message comes up and then I get a blank screen that
after about 2 minutes shows a couple of "bomb" icons.

What files do I need, where do I find them and I how can I get my
drive back.

Thanks for any help.

1490. ATARI 1040 STFM monitor problem

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-07 00:00:00 UTC
From: Peter Brown <bushkids@mailbox.uq.edu.au>
Message-ID: <01bc5a93$f0ddeea0$0c936682@zzbushkd.slip.cc.uq.edu.au>
Source record: 17125

I have an ATARI STFM circa 1989. The Atari sc1224 monitor is kaput. When I turn it on the on light flicks on and off like it's trying to start but can't. I assume this is a power supply problem? Is this fixable? and if not,
(1) What other monitors are suitable?
(2) what lead do I need to connect to a TV. (I am guessing an RCA-RF?)

Thanks for any ideas

1491. ULTIMATE ATARI PRGS LIST !

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-07 00:00:00 UTC
From: dipching@ping.be

I'm very pleased to ascertain the enthousiasm for my first announcement
about the ultimate list for atari programs available to download from
web pages ...

Please, go to see by yourself what is becomed this page ... it's
growing up from day to day and I'm only waiting for people who don't
yet have send me their program to put on ... english programmers are
certainly not the least ... far away from that ...

So if you have developped any kind of program for the atari platform,
don't hesitate anymore to communicate the following data ... I will
put them as fast as possible on the page (within two days ...)

Program NAME.
Author NAME (you, little genius ...)
The URL ADDRESS from where we can download this (these) little marvel.

Thank you to everyone who has sent datas about programs ... even if
they have not developped themselve the program ... they have found it
somewhere in the gigantic web ...
thank you for your continuous collaboration ...

How, let's go futher, this list must become THE ULTIMATE ATARI PROGRAM
LIST available on the web.

>>>>>>>>>>>>http://www.ping.be/~pin10575/PRG-IND.HTM<<<<<<<<<<<<<

Sincerely
Jo

Some boxes are empty in the table board ... if you know what to put inside,
be cool, send the missing data to me ....

Bye

h> Has anyone had problems like this? What should I do? before I start
h> desoldering key-switches, can someone tell me how they're made, what
h> to look out for and where to get spare parts, if I need any?
h> Are these "standard" keys, for say.. ALPS or something?

Errrmmm ... I think I'm right in saying that they are the same cheapo keys which come with the ST. They comprise a rubber "mushroom" dome with a contact at the top. This is depressed onto a PCB which has a copper contact printed onto it.

The usual problem is just grease/tobacco deposits/dust. A rarer problem is the fracture of the contact button in the rubber dome.

It's boring but easy to refurbish:

1.Remove k'bd.
2.Remove all the small screws securing the PCB to the plastic k'bd moulding.
3.CAREFULLY lift PCB from moulding - the rubber domes will probably spill out all over the place - catch them.
4.Clean PCB contact points with iso-propyl alcohol or similar.
5.Clean domes and contact buttons - look for any damaged contacts.
6.With keytops face down place the domes in the key bases. Just ONE dome in the ENTER key, two in the SPACE bar.
7.Lower PCB onto moulding and re-screw.

You have to create a drive with DOS compatible partitions. You can do
this either on the PC, e. g. with fdisk and format (not very much fun to
use) or with HDDRIVER 6. With HDDRIVER 6 you can create DOS compatible
partitions on the Atari the same way you get TOS compatible partitions.

> there any problems moving data from a drive that was partitioned using
> Bigdos to one that wasn't on the same SCSI chain? Is a Bigdos partition compatible with
Cubase Audio Falcon?

There is nothing like Big-DOS partitions. There are only TOS compatible
partitions and DOS compatible partitions. Either you have a drive with
TOS compatible partitions or with DOS compatible ones. You can't mix
these partition types. As far as I know Cubase doesn't support DOS
compatible partitions.

Sounds like you "moved" it, instead of just copying it... I would recommend
getting:

1. HD Driver (if not this then)
2. ICD's PRO Utils (and if not this then)
3. The latest version of ADHI, which I think
is 6.02... (can someone verify that?)

Until then, you should still be able to boot up from floppy. You did have
backups on floppy, right? :)

Source record: 17132

Hello from Singapore,

Due to the jam hard disk my Stacy overloaded and apparently killed its AC Adapter.

I have changed the hard disk but the AC Adapter does not give enough current to power the Stacy and hard disk. Now I have to temporary use IBM power supply but it only has 12V whereas original Stacy AC Adapter is 16.5 Volts, Therfore the screen is very dim.

Which components in side the adapter which likely to give this problem? Is there any easy way to repair it?

I also would like to know if there is a suitable battery available for Stacy by now. I bought the first batch Stacy 2 which does not even have the connector terminal inside its battery compartment.

Any advice would be much appreciated.

Thank you for your reply.. I appreciate it. It seems I'll need to
upgrade from HDDRIVER 5.xx to 6.xx from your message. No problem.

But what you didn't mention is how I can get Bigdos 6 which, if I
understand correctly, is the correct version to use with the Falcon.
Any ideas?

Thanks..

I certainly can't speak about your particular PC emulator board but every
one I've ever used can't see any ST disk partitions bigger than 32mb.
Perhaps this is the problem?

Dan

It is still illegal to post copyrighted software in newsgroups without
the copyright owner's permission.

TOS is over (WILL over!) 32k in size, so if it does get posted, it will
be cancelled immediately by the bincancel 'bot.

Finally, if you want an emulator that doesn't NEED a TOS image (nor any
special drive formatting/partitioning) you should get TOS2WIN - there's
a functioning demo at aixit's home page, and I use it quite often; I'll
be buying the full version as soon as possible. you can find a link to
aixit on my Web site (see .sig below).

Gentlemen, thank-you for your help and suggestions. I now have to find out what is terminating my Falcon's SCSI port and un-terminate it! AFAI can see, the internal SCSI drive is connected to the motherboard with a 15 or 18-pin connector like this:

```
.....
..... ..... x
```

There's a short red wire that connects to the motherboard where the (x) is. I haven't a clue what this does, but when I accidentally removed it the drive wouldn't even spin. I guess this must be the power to the HD!

Am I right to believe that the termination is normally a resistor which crosses two of the SCSI terminals?

Thanks again,

Jim

I need Software developers who can program highly advanced graphic programs.
The Software needs to run on Unix Workstations and Windows NT/95 environment.

It is not a one person project. You will be working with multiple people.
So you have to know(or learn fast) how to work in a team.
It doesn't matter were you live. 'Cause we can have contact through the Internet.

If you think you can do this, PLease ReMail this message and tell me something
about yourself and your work(not neccesary). And I will send you some more information.

Sincerely

Ruben Daniels

h> I'm having intermittent contact problems with my "T" key on my STe's

h> Has anyone had problems like this? What should I do? before I start
h> desoldering key-switches, can someone tell me how they're made, what

They're not switches in the normally accepted term, but are inverted rubber "domes" with a small disc of carbon inside. When you type on a key the dome squashes, the disc makes contact across two pads on the keyboard and the elasticity of the rubber pushes the keytop back up.

Aside from cleaning the carbon disc I don't think that there is much that you can do, be careful to note that there is one dome less than there are spaces as one key looks like it should have two domes.

Speak to 'ya later!

That's the point on your mainboard how was hold three 8-pin resistor packs
for scsi-termination before c-lab build in the internal scsi-port.
That short red wire is +5 to support the internal scsi-terminator on your scsi-device.
(I think so)

Your internal drive do not have any power connector like a 'normal' drive power plug?

>There's a short red wire that connects to the motherboard where the
>(x) is. I haven't a clue what this does, but when I accidentally

Hm, the problem is: i can't see that wire ;-)

>Am I right to believe that the termination is normally a resistor
>which crosses two of the SCSI terminals?

Right, you have 330 Ohms between +5 and the terminal and 220 Ohms between the
terminal and GND. (Normaly) At this point any pin 1 of all three resitor
packs is GND All pin signs with '8' are +5 VDC

Have a look into DOITF30, so you found Falcon's SCSI-Schematics in there..

Regards, Robert

1509. Zip Drive on Atari Falcon'030

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-09 00:00:00 UTC
From: Andrew Hague <andrewh@codemast.demon.co.uk>
Message-ID: <5kures$igf@neptune.theplanet.co.uk>
Source record: 16998

Could anyone tell me what is the minimum configuration of software and drivers that I need
to connect a Zip Drive to an Atari Falcon 030. I already have a SCSI Hard Drive connected to my
Falcon.

If you need more information about the setup of my machine before you can give an answer,
I will gladly send it too you.

Not just two, but three seperate resistors like Robert says. There should
be one installed in each of the "connectors" that C-Lab hacked, er, installed
on the motherboard. Becareful with these as the material they used on mine
didn't like to be soldered to and the joints were very brittle. Just pushing
them side to side a little could cause a bad solder joint. I tried a couple
of different kinds of flux until I got a decent solder job, but don't get any
on your motherboard:)

Since you already have a SCSI drive connected, then you don't need
to worry about supplying termination power to the Zip.
AFAIK
if you are using it on an Atari and a PC you need BigDOS06
plus
-if your present driver is AHDI(Ataris) you might need AHDICNFG
(by Uwe Seimet)to configure your driver so that it will "see" the Zip
[Ataris driver will scan intil it hits an ID where there is no drive,
i.e. if you have 2 SCSI drives set to 0 and 1, and the Zip, then the
stock Atari driver will only see SCSI ID's 0 and 1, and stop after
that. AHDIConfig will tell the AHDI.sys about the Zip ID way down the
chain at SCSI ID 5 or 6]
-if your present driver is ICD it should see the Zip.
-if your present driver is HD Driver, it will see the Zip
-if your present driver is SCSItools, it will see the Zip.
hope this helps

On the Falcon, Wax D2D Pro will play large AVR files of any size.
I haven't tried WAV files with it. I think wavplay plays from
hard disk, but it dosen't do any sound justice. When using
Wax, it will want to default to it's own file format when loading
a file. If you change the extension in the file selector to the
type you want to load (ie, snd.xxx to snd.avr) it will load
the file and play it. It's not perfect, but it will play a
20mb file copied off a CD with ExtenDos.

While it seems easy to find direct from disc players for formats such as DVSM and AIFF, I have been unable to find such a player for WAV format files.

I have some such files that are several megabytes long, and playing direct from disc would be much more convenient than having to play them from RAM.

Any suggestions about where to obtain such a program would be appreciated.

1520. Re: Zip drive on C-Lab Falcon MkII

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-09 00:00:00 UTC
From: escher@netcomuk.co.uk
Message-ID: <3375dcf1.3627854@nntp.netcomuk.co.uk>
Source record: 17146

Robert,

Thank-you for your e-mail. I have added a few comments below which
might explain my problem in a little more detail.

>>AFAI can see, the internal SCSI drive is connected to the motherboard
>>with a 15 or 18-pin connector like this:

This is a more accurate picture of the internal connector board:

```
......
...... ...... Connectors (SCSI ribbon to motherboard)

.................. X This is where the cable is connected and
```

the 'X' is the "little red wire" :-)

>That's the point on your mainboard how was hold three 8-pin resistor packs
>for scsi-termination before c-lab build in the internal scsi-port.
>That short red wire is +5 to support the internal scsi-terminator on your scsi-device.
>(I think so)

That sounds correct as there doesn't appear to be any other sort of
SCSI termination, either on the SCSI port, internal cable or
hard-drive.

>Your internal drive do not have any power connector like a 'normal' drive power plug?

This is strange - but no it doesn't! I suppose the drive must get its'
power from the SCSI connection. When I opened the case and saw that
the power plug was missing I spent some time trying to locate where it
had gone! The drive has no dip-switches or instructions, either :-(

>>There's a short red wire that connects to the motherboard where the
>>(x) is. I haven't a clue what this does, but when I accidentally
>
>Hm, the problem is: i can't see that wire ;-)

This is a problem :-) I think your suggestion that it provides +5V
to the HD must be correct, but I will test it just to be sure.

>>Am I right to believe that the termination is normally a resistor
>>which crosses two of the SCSI terminals?
>
>Right, you have 330 Ohms between +5 and the terminal and 220 Ohms between the
>terminal and GND. (Normaly) At this point any pin 1 of all three resitor
>packs is GND All pin signs with '8' are +5 VDC
>
>Have a look into DOITF30, so you found Falcon's SCSI-Schematics in there..

I'm still trying to find a way that will allow me to move the archive from a PC to my Falcon as I can't unzip the file on the PC. Of course, if I could get the Zip drive working I would be able to do this - but then if I could get the Zip drive working I wouldn't need to read the information in DOITF030 ;-)

>Regards, Robert

Thank-you very much for your time - it is very kind of you to help, especially converting your knowledge into English for me :-)

If I get this thing working I will let you know how I did it - it may be useful information for future reference.

Regards,

Jim

Basically any driver should work. Note, however, that you need HDDRIVER
if you want to use special features of your ZIP drive, especially the
read/write protection features.
A demo version of HDDRIVER 6.3 is available from
acp5.chemie.uni-kl.de/pub/atari/hddriver63_demo.zip or
http://acp5.chemie.uni-kl.de/seimet/atari_english.html

There is such a thing as a VME card cage that will hold several cards at once. Where you would go about finding one is another problem. The VME bus is a standard bus in Motorola industrial computers and controllers so they are available, I just don't know where.

Yes, that was ok allways. Thats the way of c-lab ;->

>That sounds correct as there doesn't appear to be any other sort of
>SCSI termination, either on the SCSI port, internal cable or hard-drive.

Hm, you have any scsi drive on your external scsi-port too?
I think your internal scsi drive must have a terminator.

>This is strange - but no it doesn't! I suppose the drive must get its'
>power from the SCSI connection. When I opened the case and saw that
>the power plug was missing I spent some time trying to locate where it
>had gone! The drive has no dip-switches or instructions, either :-(

Right, if you don't have a 'normal' power plug so your drive takes
power thru that red wire. gnd comes over some wires in the flat cable.
(That's a bloody modification!) (I don't like that..) :-)

It's very bad without and instructions/manual, so have problems
to chance scsi id's, termination and also..!
Ask your dealer for a drive manual? (idea?)

>This is a problem :-) I think your suggestion that it provides +5V
>to the HD must be correct, but I will test it just to be sure.

Witch format is your internal drive? 3.5" ??
(You have a smaler 2,5" drive)

>I'm still trying to find a way that will allow me to move the archive
>from a PC to my Falcon as I can't unzip the file on the PC. Of course,
>if I could get the Zip drive working I would be able to do this - but

>information in DOITF030 ;-)

Ahrg, sure, that archive is realy big. (and it's grown up evry month) ;-)
I see that problem and i have made some smaler archives.. (HD-disk friendly) ;-)
For all information you take three archives with 1.3 Mb data, it's easy
to store all on three hd-disks. You can take all from the same site.

>If I get this thing working I will let you know how I did it - it may
>be useful information for future reference.

OK, no problem, watch out for your hands in the c-lab case! ;-)
(I don't no i witch way these guys are fix a scsi drive into a nice falcon) :->>>

The languages for the Falcons are in the NVRAM. You can change those to suit your fancy. As for upgrading the ROMs, you'll have to go to an authorized dealer, I would assume.

Hi, we'll get right to the point. We operate one of the finest
quality custom color labs in the USA. To introduce you to our
service we're offering the following Internet enlargement special:

Your color negatives hand printed on Kodak Supra Professional
16x20 inch paper. All negatives printed full frame.
Exhibition quality and color corrected---send us any size color
negative (35mm up to 4x5 inches).

* * * * * * * * * *
16 x 20 inch color enlargement special
5 identical prints from same negative-------$79
10 identical prints from same negative------$129
* * * * * * * * * *

Most orders 1 to 2 days in the lab. Add $6 priority mail shipping;
international add $10. We accept Visa and Mastercharge.

Mail your negative(s) and payment to:

TSP CUSTOM LAB
P.O. Box 248
Lake Village, IN 46349 USA
phone 219-992-2413 fax 219-992-2644

Does anybody knows if C-Lab has a web site ? Also, are they still selling Falcon's MKI, MKII MKX ?

Recently I bought an UK Atari Falcon, and I don't know how it comes with a Spanish TOS 4.0.2 !!!!!!! I also would like to know how can I change the TOS Rom's to version 4.0.4 UK.

Thank you in advance and best regards,

Leonardo Cohen

For Sale

The ST Assembly Language Workshop by Clayton Walnum. The *best*
introduction to assembly programming on the ST.

The Motorola 68K Reference Manual. The ultimate source on the heart of your ST.

Atart ST GEM Programmer's Reference from Abacus. Documents all the ST's
calls, registers, internals, etc.

The Concise Atari ST 68K Programmer's Reference from Glentop (UK). Hard to
get in the US, this is the *ultimate* authority on ST technical details. A
lovely book!

Technical Reference to the ST - AES - Compute's series Volume 2.

Technical Reference to the ST - VDI - Compute's series Volue 1.

That's 6 books covering everything you need to know about programming the
ST series of computers. You can have 'em all for....

$10. + postage from California, or best offer.

Credit card/e-money accepted, enquire for detail.

If I don't find a buyer soon, into the trash they go. What a shame that
would be!

Here's my problem:

I recently took the write-protection key of my MIDI software out of the key slot of my atari just out of curiosity. When i put it back in, the computer would not boot up. The computer works fine without the key; it boots up perfectly, but obviously i can't use the software without it.

I called Steinberg, which is the company, to see if i could replace the key. They told me that they did not have any, for the software had been discontinued, and that my only choice was to upgrade to 4megs and get a later version of the software.

Can the key be fixed? If not, where can i get the memory and the service? I live in the San Francisco/Bay Area.

Yes, a VME expander exists, and maybe it consists only of a longer VME bus
flat cable plus connectors, but I've never seen one, so I can't confirm. One
should be available from System Solutions. If you find any new about this,
please tell me.

If VME connection standard doesn't support individual addresses for
the VME cards then you will only able to put in one VME card. The
problem being faced with more than one card/device of a type
(VME, SCSI, IDE) is that you need a way to let the one card/device
you are sending signals to know that the signals are for it and not
one of the other cards on the bus. Hence you have scsi ids so you
can address up to 7 devices and luns so you can address another 7.
If that is not a part of the VME standard, its not as simple as
adding a card select register and changing the card to recognize
the signal - you would also need to change all the calling software
to know to set the card select register. Probably more work than
you were anticipating unless you are really ambitious.

Now maybe someone familiar with the VME standard can tell us if
they use addresses or not. The above paragraph covers the issues
involved in more than one of anything. Wayne

I believe the most common failure I've seen is the "flyback" transformer. Usually the power led comes on, but nothing happens. Typically costs US$150 to get it repaired at a reasonable shop. You're better off buying another used monitor unless you're good at electronics testing/repair. Even then, the transformer will cost you US$60-80, more than a used monitor.

I just thought I'd let everyone know....

There is finally a BBS Software with all of the great features of OBV/2 and Iniquity, but without the bugs and bad
support. Infusion BBS Software is a new generation in BBS Software, modeled after OBV/2 and Iniquity with everything
that the sysop can imagine..and more.

Some basic features are:

o Multi-node upto 255 concurrent users
o Light-bar support [arrow keys]
o Requires NO Fossil Driver [selectable FOSSIL, ASYNC, and Digiboard for each node]
o Online Configuration [menu editor, string editor, evemt editor, node editor, system editor, etc]
o Pipe Color Codes
o MCI Codes
o Powerful scripting language
o Internal One-Liners, Blacklist, voting booth, etc
o Internal Z-Modem, X-Modem, Y-Modem, Y-modem-g [no limit to external protocols]
o Internal COMM Program with internal protocols, Auto Up/DL
o Great support
o Basically all of the great features of OBV/2 and Iniquity combined

Infusion has been picked up by fuEl [international art group], and Infusion 1.0th will be released June 10th.

Come to the Infusion Home-Page at http://web.wt.net/~sparky/ibbs/ and jump into the JAVA Based Chatroom,
or come to the ANNEX, the official Infusion IRC Server [irc.annex.net] #infusion / #bbs

send the author skaboy101 [Grant Passmore] E-mail at skaboy@usa.net

Source record: 17030

Hello,

Can anyone out there suggest a reliable way of getting an ancient
Atari ST Laptop to connect to a Macintosh 030 to transfer files
preferably both ways.

I say the ST is ancient, but it still does the job very well thank
you and thats why I need two way transfer.

I think the easiest way is to get a null modem cable and use
a terminal program on both machines.

Could someone suggest a suitable terminal program on the ST
(preferably free) together with a download site, AND a compatible
program on the Macintosh (again preferably free and a download site).

Please respond via E-Mail.

Thanks for any help in advance.

Jason Brown.

The manual which came with my Lighthouse TT/MSTe tower case seems to suggest that a VME expansion is indeed possible, and that you can order one from them. I say "seems" because the manual is in German, and I can't read German without the aid of a dictionary. I'll see if there's any contact info in the manual.

Brian - There's a freeware version of Gemulator called Gemulator Classic
that is available at:

http://www.emulators.com

It will run gem software reliably and quickly on your Pentium.

Gemulator runs gem programs pretty well, but it falls down in the area
of games. Also, it's a pain in the butt to get it going properly. There
is a faq around or a number of people (including myself) can help you
get it up and running. The author shows no interest in helping users.
The author of Pacifist is very responsive, answers e-mail and doesn't
even ask for a shareware fee, although he does say he'll accept cash
donations. 100frf is only about $18 U.S. or $25 Canadian, which is what
I sent.

If you want great game compatibility, sound, and the promise of great
development yet to come, get Pacifist from :

http://wwwperso.hol.fr/~gidouin/pacifist.html#whatisit

I have not been able to get Atari Works to run on Pacifist (anyone
else?) but Works does run beautifully on Gemulator Classic.

Pacifist is in heavy development and the author is totally dedicated to
making it A-1. For now, I'm sticking with Pacifist.

But if you love Calamus, why not get Calamus for Windows 95? It's an
excellent program and gives you the familiar old Calamus interface.

Pagestream for Windows is due out this year, I believe. The mac version has just been released without a manual for $50 U.S. or you can get a cut down version of the mac version on an April MacFormat disk magazine.

I don't think any emulator offers midi support yet, but please don't flame me if I'm wrong.

Good luck with your emulation!

Tom

There is a CPX archive that handles the Falcons NVRAM. Included in the file
is another program that "resets" the NVRAM. You should be able to find it
at any good Atari-supporting ftp site. Info from the CPX's "info" button
says "Boot-Init CPX v1.1"...although I don't think the archive's name is
all that! Good luck! :)

Hard to tell without knowing the symptoms but I would guess you could make at least ONE working one out of this lot.

The bits that go first are usually the power supply or the line transformer.

Repairs to the power supply are probably easy, often just an electrolytic capacitor (or two) and a fuse.

If the line transformer is bust there could be a prob. finding spares but with all these corpses about you should be OK.

1554. .XGA file format

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-13 00:00:00 UTC
From: Thomas_Kuenneth@N.maus.de
Message-ID: <199705131014.a3788@n.maus.de>
Source record: 17039

Does anyone of the fellow netters happen to have the specification ordescription
of a graphics file format with the extension .XGA?
The 'facts' so far:
Bytes 0-3: ICE! (magic)
Bytes 4-7: the length of the file a a long word (big endian)

If you want to answer via private mail please write to:
tskuenne@linguistik.uni-erlangen.de

Thanx in advance
Tommi

1556. 2 VME cards ?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-13 00:00:00 UTC
From: John.Kormylo@7861.conchbbs.com
Message-ID: <963_9705131319@conchbbs.com>
Source record: 17041

t > Now maybe someone familiar with the VME standard can tell us
t > if they use addresses or not.

Like other 68K peripherals, VME cards are accessed by their corresponding RAM address values, and any (slave) VME card can respond to any address (within the VME address range).

Therefore it is possible for two different VME cards to be compatible or incompatible, depending on which addresses they each used for their control registers (and which id values they use for interrupt requests). VME cards designed for the Atari probably were not designed to be compatible with each other.

And then a long word for the real length of uncompressed data. But
that's not XGA format but Ice packer format, you can unpack it with any
Ice or multi-depacker.

As far as I know XGA format is only a video ram dump in Falcon TC
mode, with resolution guessed from length of the datas like this:

|length| rez |
+------+-------+
|884736|768x576|
|614400|640x480|
|442368|384x576|
|368640|384x480|
|307200|320x480|
+------+-------+

Even when using the LINK II, you WILL HAVE PARITY PROBLEMS ... you
need the LINK 96 from Germany to resolve all parity problems !!!
I'm aware of that because I had to use it with my old Mega STE ...
But, you can resolve the problem by installing a soft check 'CHECK
PARITY' on the boot partition of your main drive ... though this must
be achieved by another machine with SCSI like TT030 or Falcon or best
.. any atari computer with the LINK 96 ... it exists also an old
german DMA>SCSI cable which was already a 'no parity problem' ... but
I don't remember the name of this cable !

Hi:
I've got an 2nd hand SLM804, and it's about time the toner was replaced.
So, following the directions in the manual, something like "lift the
top of the printer so that the toner/drum cartidge stays down..."
ha! It seems that _my_ toner cartridge won't stay down.
Does anyone have any more info on how to get the toner/drum parts to
stay down, so that I can replace the toner?
thanks for any help.

To make MOD files you need a tracker program. There are plenty of these on
your favorite FTP sites.

For a Web page, mods are not the best, because people who want to listen to
them will need a MOD player fitted as standard to read the mod files. This is
a lot less common than MID players. They're also larger than Midifiles because
they include their own samples.

Besides, I HATE MUSIC ON WEB PAGES! They are just a waste of bandwidth
because they download themselves even when you don't want them or can't read
them, and when your websurfing at work or late at night they're just a great
big annoyance.

Now if you want to make them available so that the user has to click on them
to get them, that's fine, but PLEASE DO NOT EMBED THEM!

Nick

Can't help you with the Mac end of things, but I suspect the answer
will be "go to www.sharewarre.com and search for terminals."

For the Atari end, get the demo version of Starcall, or get Uniterm.
Starcall is far more modern, but it's shareware, so if you continuie
to use it, you'll have to register eventually (which is a good idea
anyhow). You should be able to get them both through shareware.com,
or filez.com (a good site if you know the filename but difficult to
search otherwise).

If your Mac has the ability to read PC-formatted disks, you can also
use any of the various 3rd-party PC-compatibel formatters for the ST
and move the files via floppy disk. This is recommended only if you
have a very few files.

I have a MOD on the "Album" part of my web page, it sounds far better
than any mid, and is only around 20k, the plugin for ibm compat' is
only 70k, I am sure a Falcon one could be done, with small mods they
do sound better than midi, and just like pictures, backgrounds,
borders ,buttons and seperators amongst many other things, they are
there to enhance and make the page a nicer place to visit,

5-14-97 >>>>>> [][] ATARI Clearence SALE [][] <<<<<< 5-14-97

I have accumulated quite a bit of atari stuff! I didn't realize it was
that much until I moved into my new place, and found I didn't have room
:) So it's time to thin out the less used items.

Item : Complete System
Computer : Mega 4 w/ 4mb RAM and TOS 1.04
Monitors : Monochrome * AND * Color w/ Monitor master
Monitor Models : SM124 and Goldstar SC1224
Software : Over 100 original games (100's of disks?) plus misc.
Comments : utils. Also includes joysticks, a mouse and mouse pad
Comments : 2400 baud external modem and the mega4 has the original
box

Includes whatever programming manuals/software that I might have that
you want. In short, if you want more (asside from the Hard Drive) w/o
paying more, (FROM MISC AREA ONLY) I'll pry throw it in
(depending on what it is)

Asking : $300 + shipping

Item : Complete External Hard drive setup
Host Type : ICD Link
Megabytes : 139mb formated
Type Case : Plus Impulse flat case
approx size: 13(width) 2.5(height) 14.5(depth) (inches)
Comments : Includes DMA cable, Power cord, ICD software
Comments : Plug 'n Play - Autoboot w/ICD
Asking : $150 + shipping

If you want something from the Misc area, i'll pry throw it in -
depending on what it is.

[-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-]
M I S C
[-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-]

If you want something listed below - make me an offer!

Item : ATARI LAZER 'adapter' box. I can't remember what these are
called.
Comments: But they are the boxes that plug into the computer
and the lazer printer plugs into this box. Comes with the
Lazer printer cord. And 1 DMA cable (as it's built into the
box) This box also has a DMA pass-threw.

Item : 6 (?) MFM hard drive mechs.
Comments: I don't know what works, and what doesn't. They all did work
when I put them in the box, but I cannot test them at this
point.

Item : Blitz Cables
Comments: Allows you to backup your software fast and easy!

Item : ST Sound Digitizer
Comments: Made by Hippo, includes software and cartridge

Item : Video 1000-ST
Comments: Includes Cart and german (paper) docs. Screen rez enhancer (?)

Item : Video Key
Comments: Lets you hookup your atari to a TV

Item : Mouse Master
Comments: Lets you click over between a mouse and a joystick on 1 port
(usually 0)

Item : 1040 power supply
Comments: Needs plug put back on (which I still have)

Items : SwitchBack
Comments: Difficult to explain what this is. This lets you save anything
to RAM or a file. (Not the best explanation, but best I
can do)

Items : Video Master
Comments: Allows you to take color (?) snapshots from your VCR

If you have any questions, or your interested in one of the items
listed above, Email me! All funds must be in US Dollars. I will ship
ANYWHERE.

1574. Spy people on the Net

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-15 00:00:00 UTC
From: benh@hotmail.com
Message-ID: <337b9569.3350479@bang-olufsen.dk>
Source record: 16959

I present here my two most recent software which I hope they interest you.
they are progammed by Turbo C++ and run under Windows(3.11 and 95).
here is a short description of these two software.

1-Robot Spy 1.0
at my knowledge, this software is the first and the unique of its kind.
This software allow you to spy your friends who are on the net at the same time
of you, it permits to see exactly what they do on their screen, pixel by pixel,
anywhere, in the world, at the condition they are connected to the internet.
how does-it work?
it's simple, you send a file to the person you want to spy telling to him it's a
game or everythings else, the objectif is this person run the file. from this time,
a batch file is installed on his computor, and everytime this person use internet,
this batch connects him secretly on our server.
on your side, you , after the installation of the other part of the software every time
you want, you can connect on our server with your password and have the list of all the
persons who received your batch and who are connected at this time.
the only thing you have to do is to click on the name of the person you want to spy.
a window opens containing exactly the screen of the person spied, you can have
ten pictures per second with 256 colors, if you switch to balck and white mode you can
onbtain a real time sequence, approximatly 30 pictures by second.

Robot Mailer 1.1
The message you are reading presently is sent to more then 20,000 newsgroups with
this software. This program automates FreeAgent, and reach with a connection of 28,8 Kbauds
5,000 news per hours. It can also find a maximum of 50,000 e-mail adresses from internet
and
send a message in 4 or 5 hours. You can obtain with this sofware the most powerful tool of
mass transmittion on the internet.

Robot Spy 1.0.................20 US$
Robot Mailer 1.1.............20 US$
Both.............................30 US$

I'm sorry i can't accept credit card, but you can send an international money order to:

Ben Hedi Nassef
1481 Ste-Catherine est #7
Montreal, PQ, H2L-2H9
Canada

Don't forget to include your e-mail on a paper, you receice the software ordered in your
e-mail the day we receive the money order.

1575. Urgent Help with Falcon IDE drive needed

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-16 00:00:00 UTC
From: dbeards@f1.net.au
Message-ID: <5lhhjf$cnj@news.geko.net.au>
Source record: 16960

Hi all,
After experiencing alot of problems with the original Falcon IDE drive, I decided to buy and install a new one. The orginal completely crashed, leaving bombs (and therefore total computer lockout) during boot up.

I purchased an IBM 160 meg 2.5 inch drive (model WDA-W2160).(Writing on disk - P/N = 06G6558, FRU P/N = 54G0154, MLC = 038688)

I installed it, the computer booted fine, however I am unable to install HD driver v6 or atari's driver. HD driver says that no logical device exists even though the IDE check option displays the following info:
IDE 0 = WDA-W2160
Heads = 10
S.P.T. = 34
Cylinders = 989
Atari's install software says that the drive was formatted with a previous version and should be reformatted. I tried this but the formatting dialogue stayed on screen for a long time so I rebooted.

TOS does not do an IDE check during boot - up.

Any advice, help, suggestions or support will be greatly appreciated.

I have just recieved Magic 5 & NVDI 4 and am itching to use them.

Is there a solution to this problem or should I give up and buy a ZIP?

Best Regards
David Beards

1580. Hard Drive taking Dirt Nap!

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-16 00:00:00 UTC
From: jmirando@streport.com
Message-ID: <uNc7N7mY8GA.240@nih2naac.prod2.compuserve.com>
Source record: 16965

Okay folks,

Remember how, several weeks ago, I was saying that something in my MiNTnet setup was continually trashing FATs and directories? Well last night my computer crashed big time, and now it won't even see the internal hard drive! Now it looks like it was a different problem that just looked like MiNTnet was doing it. The drive is a Seagate (~248 meg, I think) and has worked quite well for several years without any hardware changes, so I'm thinking that either the hard drive itself or the controller card (stock atari internal HDA) is shot.

When I try to boot with the internal hard drive (ICDBOOT 6.5.5) I get three bombs and everything locks up. I've tried using HDDriver from Drive A: and from my external Syquest, always with the same results as above. I need to have an idea of whether it's the hard drive or the controller before I go out an buy one or the other, but can't because the bugger won't boot with the hard drive, and it won't boot without the controller attached either....

Can someone tell me if there's a jumper that needs to be set to be able to remove the internal host adaptor so that I can boot from the external without the bombing? I noticed that there are three DIP switches on the host adaptor... anyone know what they actually do??

I'd appreciate any help anyone might care to offer...

Joe Mirando @ STReport

It IS a great tool - MIDI on the motherboard, a DSP for sampling and
audio playback, and all of the best music software works on the
Falcon. If you can get one, do it!

For Your Information I've been sick for the last month. Plus exhaustion and being overworked, I needed to check into a Hospital. I'm recovering and time will show how long I need to get to full speed. I'm still working to support Atari Lovers and Users. If I seem unresponsive and slow please bear with me. I'm doing my best.

Following is only a partial list of what's in my Computer HardWare & SoftWare Catalogs. Everything mentioned on this list is on this list because I have multiples of these Items and I thought I'd list them for you. Especially if you wanted to buy More than one. So check it out!!!

Check out my Updated Atari Catalogs and find More Atari stuff! I've got HardWare for both Classic Atari 8 Bit & ST such as Gemini 10X Printers, Printer Stands, 9 Pin Panasonic Printers Ribbons, JoySticks, Labtec Speakers & Under the Monitor Power Directors to Manage & Protect your Equipment. And Hardware specifically for the Classic Atari 8 Bit: 800XLs, Commodore CM-141 Monitors, Atari 1050 Disk Drives, Indus GT Smart Disk Drives, Paddles, Koala Pads, Atari CX85 Numeric KeyPads, SIO Cables and Direct Connect Printer Interfaces. HardWare specifically for the Atari ST: 1040STF Computers, Spectre GCR Macintosh Emulators, MonoChrome Monitors, Monitor Master Switch Boxes, Mouse Master Switch Boxes, Hard Drives, Future (Indus) GT-100X Smart Disk Drives, Atari Double Sided SF314 Disk Drives, Advanced Gravis Mouse Stick Controller for the Amiga & Atari ST and Atari Mice. Game SoftWare for the Classic Atari 8 Bit: Battle of Antietam, Flight Simulator II and Scenery Disks, Gorf, Maniac Miner, Missile Command, Pac Man, Rosen's Brigade, Space Eggs, Space Journey Math Educational Software, Target Practice, Temple of Apshai and Zork. Game Software for the Atari ST: Advanced Dungeons & Dragons-Heroes of the Lance, Arkanoid, Brataccas, Defender of the Crown, Flight Simulator II, Gauntlet, Kings Quest, Major Motion, The Pawn, S.D.I., Sherman M4, ST Karate, Ultima V, UMS I & II & World Championship Karate. Productivity Software for the Classic Atari 8 Bit: Atari Basic, Atari Writer, CardWare, Home Filing Manager, Home Pak, Invitation to Programming, Print Shop, SynCalc, SynFile+ and VisiCalc. Productivity Software for the Atari ST: Analyze SpreadSheet, DacEasy Accounting, Data Manager ST, Degas, Degas Elite, PageStream, ProCopy, Turbo ST and VIP Professional. Plus a wealth of Books and Reference Materials. This and more you'll find in my Atari Catalogs!

See my Web Site at www.teleport.com/~bensmith/bscomputers.shtml for Bravo Sierra Computers. Where you'll find Both Classic Atari 8 Bit & ST HardWare, SoftWare, Books and Accessories. In BSC's Catalogs, you may find something you've been looking for. Something you might want. Even Something you may of Forgot! At BSC's Web Site you can View, Capture &

even DownLoad Atari Catalogs or E-Mail BSC at the Web Site! Or Request Catalogs by E-Mail. Do You Have problems Reaching BSC's web Site? Why not DownLoad FREE Catalogs at ftp.teleport.com/vendors/bensmith/ or Feel free to Request catalogs through E-Mail. Really, it's no inconvenience. All I ask is that you specify Atari 8 Bit, Atari ST or both. Then I'll send them to you by E-Mail Only. Not Snail (Postal) Mail. I will get back to you after the weekend. Please let me know if I can't attach files to your E-Mail. Please Direct any and all Replies Through E-Mail to bensmith@teleport.com. Or call Weekdays, Anytime, in Portland, Oregon. U.S.A. at (503)256-9974.

Now available on Bravo Sierra's FTP Site also available through the BSC Web Site is the ShareWare version of Carina BBS (CAR_BBS.ARC) By Shadow Software. The Best, Most Powerful BBS SoftWare on any 8 Bit Computer Platform. Also from The Shadow of Shadow Software (my Boss) a File called TESTERS.ARC. ShareWare from Shadow SoftWare that on your 8 Bit Atari, lets you tests JoySticks & Paddles plus all your JoyStick Ports. You can test all 4 JoyStick Ports on a 400/800 & all the Joystick Ports on any 8 Bit Atari Computer. Both for the Atari 8 Bit. Register with Shadow Software to keep the support coming. And for those of you who wan't to run your Atari ST SoftWare on your PC, their's TOS2WIN.ZIP. This ShareWare Emulator from Germany has advantages over the GEMulator! This Emulator is SoftWare, so the faster the PC, the Faster you can run your ST SoftWare. Also, you don't need to process your Atari files in a special manner. Like in an Image format. Nor do you need to set aside a special area of your Hard Drive for your ST Files. Plus you should be able to use all your peripherals. Register and Support ShareWare!

I've added to my Web Site a page for Oddities. Rare Atari Vaporware that never made it to market such a 1090XL expansion Box. The Shadow of Shadow Software tells me it is the Best one of the Few Atari made. And one of the Last of these Prototypes made. Which means it's the closest to being perfected. Also 3" Amdek Disk Drives. Don't be mistaken, I don't mean 3.5 ". I mean the 3" standard that they stopped making soon after they started. Their are two 3" drive Mechanisms in each case. Something few have seen but read about them on my Web Page. Go directly on the web at: www.teleport.com/~bensmith/oddities.htm

Also, on BSC's Web Site! Links to Atari Support at other Locations... At one link you'll find a Link to a Web Site with Michael Currents List of Developers and Others who Support Atari. And Bravo Sierra Computers is on the list. Also, you can find A list of Atari Support on BSC's Web Site. The Atari Developers, Sellers & ReSellers of Atari that I go to for Help.

Dave, I don't have any direct experience with this drive, but I
suggest you double-check the jumpers - it should be set for "single"
if that option is available, "master" if not. The Western Digital
drives (and judging from the markings, this drive was actually made by
WD) will not respond properly if set for "master" and there is no
"slave" present; I discovered this completely by accident when
installing a master/slave setup with a CD-ROM as the slave drive.

If you can get HDdriver to recognize the drive, patition it with that
- I have been VERY happy with version 4.61 here.

And if that doesn't do it, get a ZIP. I have found that the SCSI
connector is almost twice as fast as the IDE, in spite of the speed
ratings given by the various test programs available. Empirical
evidence (load time for a 10-megabyte file) shows the SCIS bus is
faster.

Yea, what Jo said:). If you have a PC IDE drive around (anything except the
2.5" Conner's) try running an FLC from hard disk (make sure it is larger
than available memory for the Apex player). On a fair to good IDE drive, you
will notice that a large resolution FLC plays much smoother from the IDE drive
than the SCSI, providing the IDE is faster than the SCSI drive.

That really depends on the drive. HowFast rates my Qantum Fireball to 4Mb/s, twice as much as the
theoretical limit for SCSI-drives (~1.8Mb/s). This is on a Nemesis'ed Falcon though, but even in
16MHz I get ~2.5Mb/s.

But my old 250Mb/2.5" Conner didn't reach even 1Mb/s, a pathetic figure that almost all SCSI-drives easily beats.

Did you start HDDRIVER.PRG from floppy disk before starting the HDDRUTIL
program. As mentioned in the HDDRIVER manual HDDRUTIL relies on an XHDI
compatible driver being installed.

With IDE drives on a standard Falcon you can get transfer rates of appr.
2.3 MByte/s With SCSI about 1.8 MByte/s are the maximum. If your Falcon
has an accelerator card build in IDE gets even faster.
Note, however, that IDE transfers are not done using DMA on the Falcon.
So depending on the application SCSI can be faster if you're using MagiC
and DMA background transfers.

>Even when using the LINK II, you WILL HAVE PARITY PROBLEMS ... you
>need the LINK 96 from Germany to resolve all parity problems !!!
Dear Jo,
I use everyday a ZIP Iomega connected to my MegaSTE with a LINK II. I never had any problem. I do not say *you* never had any, but, as you can see, this does not seem to be a general problem.
This has worked with every driver I have used : Protar, AHDI and now HDDriver.
The only thing a bit peculiar with the ZIP is that you must provide termination power, but only if the ZIP is the only device along the SCSI link.

: One: What's the difference between a 1040 ST and 1040 STF?

I believe the STF indicates that it has a double sided disk drive?
I could be wrong here...but I do seem to recall that some of the first ST machines only had single sided drives, and when they made the double sided ones standard, they stuck a little f on the lable. An STFm label will signify that the machine has a composite video output for hooking to a television set.

: Two: Can a 1040 with a bad floppy(internal) just have a new standard 720k
: drive installed?

Yep...most of the High Density drives can be installed as well...but you will only get DD capability from it unless you install a HD kit. My understanding is, that you can put just about any 3.5" floppy drive in there, plug it up, and it'll work. You might have to file or otherwise modify the ST chassis a bit to make way for the positioning of that particular drive's release button.

: Thanx.

No, "F" just means "Floppy." It will have an internal floppy drive,
but SSDD/DSDD is pot luck.

Hi Everyone.
I just installed my Atari 4Mb TT-RAM board(4 soldered 1 Mb SIPPs).
Anyways, my TT displays "TT-RAM XXX... 4096K" then 4 bombs.
There are three jumpers on the TT-RAM board plus another three
jumpers between the TOS 3.06 chips.

I presently have 4Mb ST-RAM also.
Which jumpers do I need to change?
Thanks.

I think that if your key is broken it will be impossible for you to fix
it.

If you want to update the memory of your ST, you can use 30 pin SIMMs from
any old PC, they are compatible. (I think it will be impossible to find
Atari memory blocks nowadays)..

I hope this information will help you.

Your faithfully Anton.

1606. Gemulator Classic

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-19 00:00:00 UTC
From: Dan Phillips <xiting@worldnet.att.net>
Message-ID: <33813E6B.340D@worldnet.att.net>
Source record: 16991

I just downloaded Gemulator Classic to be able to use Calamus while the Falcon is in the shop and can't figure out how to get hard drive access. The Gemulator FAQ mentions the .vhd files and a file like sthdboot.seq but I didn't get anything like these with the distribution, only GEMUL8R.EXE. Creating files and naming them as the sample .ini file in the FAQ didn't seem to work. Has anyone already explained this and could send me a copy?

Also, what will happen if I use TOS_162.IMG? The Emulators Inc page says it's not supported by Classic, but it seems to be working just fine.

Thanks,

Dan

BTW, here are my benchmarks for a 32 MB RAM AMD DX4/120 with Number 9 Motion 771 VLB and no Magic or NVDI, if anyone is interested:

As plug'n'play, yes. You will need one the 'SM' series hi-res monitors. These
can be found 2nd hand for about US$100.

Another solution is to hack a standard PC SVGA monitor with a special
home-made adaptor, but then you will need to find one of those non-standard
atari monitor connectors.

IMO the best solution is an Atari SM monitor as they have a very crisp
monochrome display (SVGA monitors will always use 3 RGB color cannons to make
a B/W image resulting in a less precise display).

This is in the Atari ST Quick FAQ at:

Well, it is up and running as far the Desktop is concerned.

You should have 3 icons too with Floppy A, Floppy B and Trash. If that's not
the case, then your floppy drive is not connected correctly.

You might want to check out my Atari ST Quick FAQ, which has a section for
complete beginners. Check out my .sig.

Not quite pot luck

1040STFs all had DSDD drives, whereas 520STFs had either SS or SD both
depending on the year.

I beleive that the DSDD drives were introduced on 520STFs at the same time as
rainbow TOS (TOS 1.4/1.04).

Did you partition the drive before you tried to install HDDriver? You
can't install any driver as long as there isn't at least one TOS
partition on the hard disk.

Ciao

The three DIP switches control the SCSI ID that the HA reports to the CPU (the actual drive ID must be zero). that allows you to use an external HA/drive as the boot drive, even with Atari's drivers.

Disconnect the ribbon cable from the drive and see if you can boot from floppy (or, if you have the patience, with no disk at all). I'm sorry I can't tell you which pins to jumper to remove the HA altogether. Is this a Mega STe? Must be, the TT HA is't removable...

Hello,

Roni Music Home Page offers free down load of the Sweet Sixteen MIDI
Sequencer for Atari computers.

Sweet Sixteen is a comprehensive and powerful MIDI sequencer for
PC/Windows and
Atari ST/STE range of computers.
Sweet Sixteen offers Piano Roll, List and Transform edit pages as well
as a
dedicated Mixer page you can use for your favourite synthesizer.

Three versions are available:
1. A shareware version which is a complete version of Sweet Sixteen
which you may try out for 30 days.
2. A demo version which is a complete version of Sweet Sixteen with all
file saving disabled.
3. A "lite" version which lets the user save files but certain other
functions are disabled.

Check it out at: http://home1.swipnet.se/~w-11396

Sweet Sixteen is $ 29.95 US

this is only possible if you can find a system level utility for the PC
to be able to read other than bog standard 720K or 1440K disks.
Unlike the Atari which can read just about any disk that its drive can
handle, the PC is pretty finicky! :^)
I used to run such DOS programs in my config.sys, but that was _ages_
ago, I can't remember the name/s, sorry

good points Rich, but having three IBM drive, all labeled WDA... I must say that it is an IBM drive, not a Western Digital drive.
The ID jumper selectors are on the front of the drive, the cabling and power connection are on the back.
You must boot from a floppy(hold down the Alt key when booting if you must)
with HDDriver or AHDI in the auto folder. Then run HDutil and format/partition
the IDE drive. It took a number of tries for me before I could access the IDE
drive. I don't know why. I often find that after I configure HDdriver.sys
and reboot, the new settings haven't taken, verified when I rerun HDutil, and
I have to configure HDDriver.sys again.

1618. Rechargable battery for TT030

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-20 00:00:00 UTC
From: RCain@nest.demon.co.uk
Message-ID: <803_RCain@nest.demon.co.uk>
Source record: 16908

Hi dipching@ping.be, on 19 May 97 you wrote:

d> I have already changed two times the rechargable battery in my TT030
d> ... but again, it's out of work ...

I don't have a TT but had the same frustration with the clock battery on the ICD AdSCSI card.

d> Buying such a product is very expansive, is there no alternative
d> solution e.g. put another kind of battery ?
d> Apparently, the battery must be of 3.6 volts.
d> Can you help me further ?

I can't remember what the voltage of my clock battery was but I took a couple of leads from the board to a AA battery clip mounted on the outside of the case housing the HDs. I have had the same 1.5v Duracell in there for YEARS

You may find the TT will be quite happy with 1.5v or yoou could use a double battery clip so you could give it 3v. It shouldn't complain about that!

>the menu items enabled. Are there any on-line instructions for it, or
>could someone please tell me how I can get it up and running?

It /is/ up and running, Frank. That's the desktop. If you hooked it
up right, you should have two icons for floppy drives (B: is virtual
if you have only one drive) and a trash can. Double-click A: with a
disk in the drive and you'll get a list of the contents.

WARRNING! This is NOT a Mac! If you drag the floppy to the trash, it
will ERASE the disk, not eject it! (I never did understand that
particular bit of Mac desktop operation - around here, when I put
something in the trash, it's 'cause I never want to see it again...).

And mine too! Sheesh, EXACT same problem :) Was strange, because if I
left the computer on for a while, and came back (room temperature rise)
it would start working... kinda... But you never realise how much you
use a key until you dont have it ;-) Took it into a local atari Repair
store (that is now out of business) and they fixed it all up for me..)
It happennend again a few months later with the Spacebar.. :) That one
was a little more harder to get around !

: jumpers between the TOS 3.06 chips.

: I presently have 4Mb ST-RAM also.
: Which jumpers do I need to change?
: Thanks.

The newer TT RAM boards it will have 6 jumpers labeled w101 to w106.

The jumpers settings are as follows:

w101 w102 w106
1M x 8 SIMMs (4MB) 2-3 2-3 2-3
4M x 8 SIMMs (16MB) 1-2 1-2 1-2

jumpers w103 & w104 are for the start address remain the same 2-3

jumper w105 is for burst mode ON 2-3 OFF 1-2

c> One: What's the difference between a 1040 ST and 1040 STF?

The "F" has an in-board floppy.

c> Two: Can a 1040 with a bad floppy(internal) just have a new standard
c> 720k drive installed?

Yes. It will need to be set to "Device 1" (jumper or soldered link). Some people have had a problem with data cable opientation with some makes of replacement drive. You can probably avoid these problems if you buy from The Upgrade Shop or some other Atari-aware dealer.

Strange, same thing happened with my Mega STE's keyboard. Quite common, it seems.
Not that I even use the Control key very much :-/

Has anyone had similar problems with the old-style Mega keyboards? The ones
I've seen were made by Cherry, which has quite a good reputation for keyboards.
The new Mega/TT ones are Mitsumi or something.

All 1040's have built-in floppy and PSU. I think the badge is the only
real difference. Perhaps the motherboard got a new design when Atari
released the new 520's and 1040's, I'm not sure about this.

Well, I just bought one of the $59 Mega STe boards from Toad's sale, just to fool around a little..

However, my experience is limited strictly to STs and Mega STs. I can recognize MOST of the ports, etc, but there are some I'm bnot sure on or baffled..

1) The power supply pinout - is it a standard PC power supply pinout? I have a PC power supply running my Mega ST + hard drive, and the MB pins are still available.

The ports I recognize on the left side are:

Keyboard connector (uses a mega-style keyboard - can I substitute my spare PC keyboard somehow?)

Cartridge port

MIDI IN/OUT

?? A small female port. No idea on this one.

Reset button

On the back:

Two RCA style connectors - I'm assuming audio-out plugs?

Joystick 0 + 1

Parallel port

ACSI port (will my ICD Host adaptor work? I hope so!)

Above the parallel & ACSI: Serial 2. I'm guessing this is the "enhanced" serial port I've heard about. What happened to the normal serial port? I don't see another one..

Looks like an RF output port similar to the one on my 1040FM??

Monitor plug

Floppy plug

As well, there are a few unfamiliar sockets on the board itself:

Empty, labelled "spare1" and "spare2" to the right of the SIMMS (assuming facing from the front)??

I've read that only DIP switch 7 does anything?

Another empty socket: U405 about 2 inches behind the SIMMS?

I guess the empty square socket by the 68K is for a 68881?

I'm assuming the port at the top right side is for the internal floppy?

Also, I thought this was supposed to have a VME bus slot? Where is that?

Any other important things to be aware of with this machine? New video modes (I know it has 4096 colours). I know about the better sound - is there a list of what's changed somehwere?

I would prefer email, but I'll read this group as best as I can.

Thanks,
Mattias

Well, of course, I was assuming that he booted with no disk, then formatted a blank one, therefore with no desktop.inf file. I think that's what he said he did.

Of course, if the drive is not connected or dead, then there will be no desktop.inf to read either.

A 2 icon setup does not show a hardware problem. If there are 0 icons AND no desktop.inf (or newdesk.inf) file on the boot disk, then there definitely is a hardware problem.

The left shift key on my Mega 2 was unreliable (and I bought it new). Now
I have a Mega STe, and I have to really whack the space bar, or it doesn't
register, and sometimes the CTRL key goes non-functional, which means, if
I'm on FreeNet, I can neither poop nor get off the pot!

The only times I've seen the no icon effect is when the floppy drive is disconnected or the keyboard is connected wrong, when you have one of those adaptors that use a regular PC keyboard. The other time was when the power was cycled quickly, courtesy of the power company.

Message-ID: <19970521200800.QAA06628@ladder02.news.aol.com>
Source record: 16921

Hello All,

I have been using a 1986 Atari ST monitor "1224" monitor for a little over a year. Since I bought it, the picture has been gradually growing darker and darker. I now use the monito with contrastand brighness controlls at maximum, and still the monitor is too dark to use with some applications and games.

I do not see any obvious, outside methods for improving the brightness. I was hoping that a member of the newsgroup could suggest some modifications or replacements that I could make to the hardware to improve the picture.

If you think you can help, please email me or post to to the ng. Any help will be very much apprecaited.

Thanks,
Jon

p.s. Any good chess games for the ST?

And the #1 most frequently asked Atari 2600 question is... <drumroll>
"What kind of power adpater do I need for my 2600?"
The answer? 9 volt @ 500 mA with a 1/8 inch, possitive-tipped plug!

Hello, I am interested in getting into assembler programming on the ST. I need to know where I can get information on programming the operating system and the hardware (not that I intend to program the hardware directly, it is more for interest).

I already have 68K programming experience with my Amiga so do not need any information on programming the machine code itself.

Thank you for your time.

Statements made and/or opinions expressed in this message

Get "The Atari Compendium" it covers operating system and the hardware.

HI,
I just got WordPerfect 4.1 for my ST & love it but have one problem.
I'd like to create a document at home, got to work & edit/print it in
WordPerfect 5.1 or Microsoft Word, save it, come home & work on it on my
ST some more. Right now the only way I can do all this is saving it as a
text file at work which means I loose all my formating codes when I come
home. Bad news... Any utilitie programs out there for either the ST or
PC that would allow me to convert WP 5.1 to WP 4.1?
Thanks for any help,
JJH

Hallvard,

TT/MegaE mylars are still available in the US (and presumably in UK as
well) for $34.99US from Systems for Tomorrow (www.SystemsForTomorrow.com).

Rory

Hello,

and thank you very much to everyone who has answered to my question,
now my problem is resolved, I have just replaced my old battery which
was not at all rechargable (normal !!! I thought it was, but I was
wrong about !!!!) ... with two 1.5 duracell battery connected at the
same place ... now it works perfectly !

Again thank you all !

Jo

1644. High Density Floppy Drive Mod (no AJAX chip required)

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-22 00:00:00 UTC
From: bm827@FreeNet.Carleton.CA
Message-ID: <5m1jpj$67t@freenet-news.carleton.ca>
Source record: 16929

I found this when going through some old disks. It still may be of
interest to some. The mod was originally written up for the local
Atari Users Group and presented at a meeting in 1993. Some updates
have been added.

Randy Kwak
bm827@freenet.carleton.ca

****

High Density Disk Drive Modification by Randy Kwak

What you need:

- CO25914 (Video Shifter Chip) contained by every Atari ST

- WDC 1772 02-02 chip (floppy controller chip) contained in most (newer)
STFM's, Megas, and (probably) STE's, etc. According to
"Atari ST Review (Mar., 1993)", 95% of these chips
will work at both 8 MHz and 16 MHz

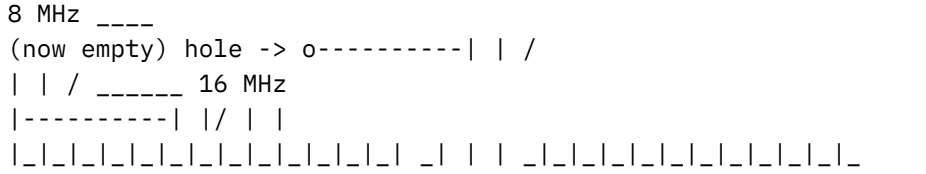
N.B. If your floppy controller chip is the older "00-02", it will
NOT work (but it will fry nicely). A chip upgrade is needed
for the mod. (N.B. I do *NOT* have or need an AJAX chip!!!)

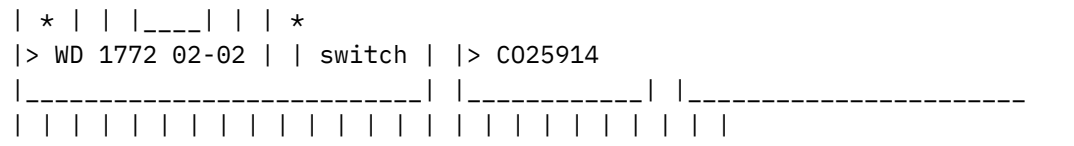
- HD floppy drive
I have an older Chinon and TEAC with multiple jumpers which work
fine. Make sure you change the drive setting from "1" (typical
IBM setting) to "0" (Atari setting).
(1997 note: many recent HD drive have *NO* jumpers whatsoever
and may not work in an ATARI; see if you can try before you buy.)

What to do:

Desolder pin 18 ("clock") of your drive controller chip and bend it up
and out of the hole. Solder a wire to it. Connnecting the wire to the
(now empty) hole gives you an 8 MHz clock (double density). Connecting
the wire to pin 39 ("16 MHz out") of the video shifter chip gives you
a 16 MHz clock (high density).

I have installed a toggle to switch between 8 MHz and 16 MHz. My setup
is the following:





Formatting programs:

- Diamond Format (HD 3 1/2", 18 & 20 sectors per track, IBM boot sector)
- H-Copy (HD 3 1/2" & 5 1/4", selectable number of sectors)

Note that the normal formatting routine from the desktop will only give you DSDD disks. This is because the HD formatting routine was not built into TOS until TOS 2.6. You *MUST* use a software formatter or have pre-formatted disks.

Problems you may encounter: "Damage on drive XX; check connections.."

- On 3 1/2" floppies, change step rate for drive to 6ms or 12ms (Double Click's "Floppy Configurator" is great for this). Reason: when you double the clock rate, the step rate is halved.

- On 5 1/4" disk drives, change step rate for drive. Additionally, you may need to construct an interface to provide the necessary logic and buffering for the drive select and motor on signals. (1997 note: I can dig this out if anyone is interested).

- IBM-compatible floppy drive may not work in an Atari. Check first to see if it works as a normal Double-Sided Double-Density (720K) drive (no modification necessary - just plug it in after changing drive number to "0"). If the floppy drive light stays on all the time, the floppy drive cable is in upside down. If it doesn't work as a 720K drive, it probably will not work as a 1.44 drive unless you can set the jumpers and configure the darned thing (you would have to figure out how to do it on an individual basis).
(1997 note: most of the recently manufactured HD floppies do not have any settable jumpers and may not work in this mod.)

Usual disclaimer:
I have successfully installed this modification in a MegaST (TOS 1.4, 6-chip set) and a later-model STFM (TOS 1.2, 2-chip set). I do not know if it will work with TOS 1.0.
I cannot accept any responsibility for any damage to your ST.

>at maximum, and still the monitor is too dark to use with some
>applications and games.

This might happen to an screen that has been "reactivated" (a
process where high voltage is used to clean the screen tube). This
reactivation won't last long if the picture tube is worn out. My guess.

> I do not see any obvious, outside methods for improving the brightness. I
> was hoping that a member of the newsgroup could suggest some modifications
> or replacements that I could make to the hardware to improve the picture.

My disclaimer first: Do this at your own risk; dangerous high
voltages inside even when the monitor is turned off.

There is a control located on the body of the Fly Back transformer
called "screen." This control supplies with medium high voltage to one of
the grids of the picture screen. Move it slighlty clockwise and see what
happens. You might be able to gain some brigthness while loosing the focus
a bit.

Hi. I have CAF 2.06 installed on the SCSI hardisk. CAF runs OK when connected with one of the falcons. The other Falcon is giving me problems. When I try to access disk recording, (right after creating the audio-rec file on the SCSI) CAF crashes and shows 11 and 14 bombs.

11 Bombs means: Line 1111 instruction, line f error. WHAT DOES IT MEAN?

14 Bombs means: Format error. WHOSE FORMAT IS BAD?

I will greatly appreciate any comments. The falcon giving me problems is the one where the timming has been fixed and was working ok.

5-14-97 >>>>>> [][] ATARI Clearence SALE [][] <<<<<< 5-14-97

I have accumulated quite a bit of atari stuff! I didn't realize it was
that much until I moved into my new place, and found I didn't have room
:) So it's time to thin out the less used items.

Item : Complete System
Computer : Mega 4 w/ 4mb RAM and TOS 1.04
Monitors : Monochrome * AND * Color w/ Monitor master
Monitor Models : SM124 and Goldstar SC1224
Software : Over 100 original games (100's of disks?) plus misc.
Comments : utils. Also includes joysticks, a mouse and mouse pad
Comments : 2400 baud external modem and the mega4 has the original
box

Includes whatever programming manuals/software that I might have that
you want. In short, if you want more (asside from the Hard Drive) w/o
paying more, (FROM MISC AREA ONLY) I'll pry throw it in
(depending on what it is)

Asking : $300 + shipping

Item : Complete External Hard drive setup
Host Type : ICD Link
Megabytes : 139mb formated
Type Case : Plus Impulse flat case
approx size: 13(width) 2.5(height) 14.5(depth) (inches)
Comments : Includes DMA cable, Power cord, ICD software
Comments : Plug 'n Play - Autoboot w/ICD
Asking : $150 + shipping

If you want something from the Misc area, i'll pry throw it in -
depending on what it is.

[-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-]
M I S C
[-][-][-][-][-][-][-][-][-][-][-][-] [-][-][-][-][-][-][-][-][-][-][-]

If you want something listed below - make me an offer!

Item : ATARI LAZER 'adapter' box. I can't remember what these are
called.
Comments: But they are the boxes that plug into the computer
and the lazer printer plugs into this box. Comes with the
Lazer printer cord. And 1 DMA cable (as it's built into the
box) This box also has a DMA pass-threw.

Item : 6 (?) MFM hard drive mechs.
Comments: I don't know what works, and what doesn't. They all did work
when I put them in the box, but I cannot test them at this
point.

Item : Blitz Cables
Comments: Allows you to backup your software fast and easy!

Item : ST Sound Digitizer
Comments: Made by Hippo, includes software and cartridge

Item : Video 1000-ST
Comments: Includes Cart and german (paper) docs. Screen rez enhancer (?)

Item : Video Key
Comments: Lets you hookup your atari to a TV

Item : Mouse Master
Comments: Lets you click over between a mouse and a joystick on 1 port
(usually 0)

Item : 1040 power supply
Comments: Needs plug put back on (which I still have)

Items : SwitchBack
Comments: Difficult to explain what this is. This lets you save anything
to RAM or a file. (Not the best explanation, but best I
can do)

Items : Video Master
Comments: Allows you to take color (?) snapshots from your VCR

If you have any questions, or your interested in one of the items
listed above, Email me! All funds must be in US Dollars. I will ship
ANYWHERE.

I had similar problems with the spacebar on my STE, til I took it apart,
and cleaned it up. Then the keyboard light refused to work. Both are
working quite well. Sometimes you have to take the time to clean up
something to get it working.

You should have seen my STE keyboard after I replaced it with a AT Key.

My falcon just died so I got my registered gemulator up and running on my daughter's notebook. Once I figured out how to load a tos img (thanks to the
faq: it's different for the demo and registered versions), it's great (though PacifiST
is certainly very good for the price).

Problems: I'm running DynaCADD, and it works great on tos206 (on MagiC it ate all the memory and wouldn't load data, despite limiting the memory through
Applikat). Anyway does anyone know how to send a keypress from a missing key (DC needs a keypad enter in order to enter text, and this notebood doesn't
have one).

Also when running full screen--great!!--there seems to be no way to get back to
windoze besides exiting.

Anyone?

Thats quite an expensive solution if all it takes is a little technical
knowledge, the guts to do it, and about $.50 to fix it...

I'm not sure, but I dont think there is a very good supply of MegaSTE/TT
keyboards in the UK (someone made a big fuss over bring lots to the recent
shows), but that doesn't matter, as Hallvard is in Norway (.no) anyway. :)

> MEAN?

The software contained an instruction whose opcode began with $Fxxx.
Normally this is for FPU (68882) or MMU (68851) instructions.

Your Falcon has a 68030 (which includes a stripped-down 68851 MMU on-chip).

> 14 Bombs means: Format error. WHOSE FORMAT IS BAD?

The software.

When an OS TRAP instruction is issued, or an interrupt/exception occurs on
a 68010 or better CPU, an extra piece of info (known as a "format word")
is put onto the stack to say what kind of trap it was.

When the software handling the exception/interrupt finishes, it issues an
RTE instruction. As part of handling this instruction, the CPU will check
this format word. If it is not what the CPU expects, then you will get a
"format exception", which usually points to the "print a row of bombs"
portion of TOS.

(Sorry if this is not as enlightening as it could be, as I do not own a
Falcon or use Cubase Audio. I do, however, program my TT)

There is - it's called Mouse2 or something like that; however, in case it's not obvious, you can't use a serrial mosue and a modem at the same time. There's only one serial port on the ST/e. The Mega STe and TT have multiple ports, which makes this sort of thing much simpler.

hello,

I wonder if there is any scsi library which allows to read/write to
generic scsi device (as under linux) or at least to write aANY commands to
scsi cdroms/cdr's.

regards,

szymon.

1663. PaCifiST line mode video

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-24 00:00:00 UTC
From: Dan Phillips <xiting@worldnet.att.net>
Message-ID: <3387C961.E84@worldnet.att.net>
Source record: 16946

I recently downloaded PaCifiST and can't seem to get the line mode video to work so I can get higher resolutions.

I have an AMD 486DX4/120 with 32 megs of RAM and a 2 meg Number 9 Motion 771 VLB card. I have installed Display Doctor and cannot get PaCifiST to run in any mode but ST screen modes. I have used W95 to set the video to 640X480X256, 800X600X256, and 800X600 in 16-bit and 32-bit modes and PaCifiST reboots the PC when I type "g" <enter> after setting the mode to LINE and the video to the setting which matches the PC's current video. I am using TOS 2.06.

What am I missing?

Thanks,

Dan

Hi All,

U.S. Robotics provides a test to see if your telephone lines will support their x2 modems. To conduct the test you need to currently have a V.34 modem. Using your terminal prg, Flash, Connect, whatever, dial:

1-888-877-9248, hit return/enter at graphics prompt, and enter Line Test at name prompt. After the test, hit H or return for your parameters.

More info at: http://x2.usr.com/linetest1.html

Again, this is USA only. However, it saved me $200 as I was going to buy a 56k modem. Alas, my lines failed the test ;)

If you already have BBS Express and it would be suitable then I suppose
you could just use that.

Otherwise, I would highly recommend Octopus BBS software. I don't recall
the URL right now, but if you check the "WWW Links" section of my WWW age
and search for "Octopus" you should find it. (See my .sig for the URL.)

One of the better commercial ones is apparently Ratsoft, but I am unsure
about where this can be obtained or whether it is still supported.

There are also a few other recent shareware (or possibly PD) BBSs -
Foresite, XBBS... although I have not tried any of these myself.

Yes, there is, and it's called mouse25. Last time I checked it could be found
on umich.

BTW, this is the Quick FAQ (see .sig below)

Hello Atari fans,

-Just letting you know about the Atari Preservation Society. The APS is a group of Atari fans trying to keep the Atari Experience alive into the next millinium! We'd like to gain more members that are experienced in Atari computers, most of our members only own Jaguars and Lynxs.

-The APS has only been around for about four months and already has 200+ members, including Telegames, a Jag/Lynx game developer!

-If you'd like to find out more about the APS, or become a member, make sure to visit the Official web site at:
http://www.geocities.com/SiliconValley/Vista/1863/main.html

Thanks for your time,

Megabyte,
Official APS Member!

Yup :))
I know that, but I think I phrased the question wrongly.

I think I should've asked :-

Does anyone know how to connect a PC keyboard to an ST, circuit diagram
for adapter? Chips used? etc :)

But thanks for replying to my query anyhow :))

I mostly get 11 bombs so I guess I should take care of that first.
I guess there is some problem in the hardware, if so, where should I
start?

THANK YOU!!!

Okay, this is going to sound really dumb, but I really need help.
I've had my ST since I was nine years old, and regularly obtained Medway Boys and Pompey Pirate disks with loads of games on them.

I've recently found some sites with these kind of disks on them on the Net, and want to get hold of them. However, I want to be able to use them on my actual ST, and not an emulator.

My problem is, the files are too big to fit onto single-density disks that my ST takes, and I haven't got a clue where to
a) get hold of smaller files;
b) shrink files;
c) make the files work having transfered them from my PC to ST (How???)

I would really appreciate any help that you experts can give me - please help me re-live my childhood!!!

Neth

P.s. Please reply through this news group, as my e-mail is bolloxed up.
Thanx!

There was a keyboard adaptor (Deka?) at one time... Try contacting Computer
Direct, Toad Computers, or Best Electronics... Good luck! :)

Check out Steffen Engel's SCSI library which comes as part of the CBHD
driver package. You can download it from any good Atari ftp site; here
are just two links:

http://www.funet.fi/pub/atari/diskutil/cbhd502.tos
ftp://ftp.uni-paderborn.de/pub/atari/tools/hd/cbhd502.tos

>
>My problem is, the files are too big to fit onto single-density disks
>that my ST takes, and I haven't got a clue where to
>a) get hold of smaller files;

The .ST files you are referring to are disk images of non-standard format
disks. These disks were often 800K or even more, so you understand that it'll
be hard to get 800K on a 720K standard ST/PC disk.

>b) shrink files;

You could always zip them on the PC (PKZIP,WinZip...) and unzip (STZIP) them
in a ramdisk on the ST (provided your ST is at least a 1Mb machine). But then
you would need an ST program to write .ST files onto real disks. I'm not sure
there is such a program.

Magic Shadow Archiver will write .MSA files to real disks, which is a similar
process. .MSA files have the advantage of being compressed too.

>c) make the files work having transfered them from my PC to ST (How???)

If you look around those Pacifist web pages you'll find a bunch of small
utilities to convert .ST to .MSA or to write directly .ST disks to PC
floppies. This should work provided you find a PC program that can format the
disks with the extended formats (sometimes upto 82 tracks and 11 sectors).

> 14 Bombs means: Format error. WHOSE FORMAT IS BAD?

11 bombs means that a fault occurred when reading the disk, and 14 bombs
means that a media change has been detected.
Have you checked all the connections to the drive? If it is only a single
program that is crashing then I would expect it to be a software problem,
although this is not always so.

Complete Atari Computer System:

Atari 520 ST
Upgraded to 4MB RAM
TOS 1.4
PC Speed Emulator card installed
3 1/2 720K Floppy Drive
5 1/4 320K Floppy Drive
170MB SCSI Hard Disk (Loaded with loads of s/w)
SM125 Hi Res Mono Monitor
Colour Monitor (With monitor switch)
Fantastic Optical mouse
Joystick

Over 200 disks of s/w with catalogue, everything
from Word processors, DTP, Compilers, Games, to Graphics
and even a PC section, with manuals.
Run all the Atari s/w and get a PC to play with as well.

This is an excellent, system which has given sterling service since new.
Technical backup and help available if required.

Very difficult to price but offers around 150 UKP
(Would consider offers for some individual items)

Email to mike.wilsher@ffei.co.uk

Hello,
I have a used Atari 1040ST with a SH hard drive and a SM124 Monitor.
I got this system for my sister, and found out that I have no boot disk.
When I turn the system on, I get a desktop type window and a folder for
A drive and B drive, but no C drive, plus a trash can.

Where can I get the boot disk for the system and a boot disk for the SH
hard drive? Where can I find programs that will run on this system? How
can I get the system to print on a tandy dot matrix printer?

Thank you,

Tony Young

There is no such thing as a 'boot disk' for the Atari ST. A plain formatted
disk will startup the desktop.

The hard disk driver software should be on the hard disk. For some reason
it looks like your ST didn't boot on the hard drive. Try switching it
on well before the ST, so it starts running first and so you're sure the
ST can access it when it boots up.

If this doesn't work, then you will probably have to get some HD driver
software to access after bootup. AHDI (Atari's HD software) is available
on most FTP sites. It's not the best driver, but it should get you started.

> Where can I find programs that will run on this system? How
>can I get the system to print on a tandy dot matrix printer?

What type of programs are you looking for ? If you want games, you'll need
a colour monitor. Otherwise you can find just about any type of application
on the ST FTP sites.

You might want to check out the Atari ST Quick FAQ (take a look at my .sig)
for various pointers to get you started.

As for the printer, you shouldn't have much problems getting it to work once
you've got software that can print.

At the moment there is no known player for MPEG-1 Audio Layer III.
Theories are being discussed, but so far nothing substantial has been
reached. MP3's require more in the area of tables and general memory usage
compared to MP2, and the memory in the DSP is limited. How much work can
be put on the 030 is unknown at the moment.

: hard drive?

My Uncle has an old Atari setup like this. You require a boot disk because the older hard drives don't autoboot. All you need to do is download AHDI (the Atari Hard Disk driver thingie) and put it on a normal floppy disk.

The floppy disk should have an 'AUTO' folder created on it (on the 'File' menu on the desktop) into which you should place the AHDI driver. You will also have to make sure that the driver program has a '.PRG' extension, otherwise it will not be recognised as a program (.TOS and so on don't work in AUTO folders).

It's best to make a backup of your boot disk and always keep it write protected.

I apologise if you find the instructions too 'verbose': I am writing it so that someone could do this without having touched an Atari in their life before.

Tony, your getting the booting of the ST itself when you get the two
drive icons of "A" and "B".

Is the Hard drive powered up and connected to the ST prior to turning
on the ST, if so, it's possible the booter software is corrupted or
the HD itself could even be bad.

Stick a 3.5 inch floppy with nothing on it into the floppy drive, and
click on drive "A" till it turns black, then come over to File and
then down to Format a floppy, try it under single side, if that works,
then try it again under 720K or double side floppy. If so, that's the
size of the internal floppy drive capacity.

Mike

You can use a PC VGA monitor for ST high resolution, but you have to builds a
special adapter.

The ST's scan frequencies are in the Atari ST Quick FAQ at:
http://www.geocities.com/MotorCity/2090/quickfaq.htm

If you can find a way to do it it would be sooo great. Is the filesize
for layer 3 files much smaller than layer 2? Maybe a converter could be
done atleast? Als using the main CPU wouldn't be to bad as it hardly isn't
used at all in layer 2. I guess you knows better what can be done and not.

A good encoder for layer 2 wouldn't be to bad either.

Actually.. the CPU isn't used for anything but loading the data off the disk.
If you have the mp2 in memory, it's using 0% CPU :)

As for filesizes.. To simplify things a bit, 112kbit mp3 == 192kbit mp2.
(According to Noring :)).

This basically means mp2 is about 70% larger than mp3.

>A good encoder for layer 2 wouldn't be to bad either.

If you find one, give the source to me, so I can use that one on faster
machines.

The latest version of AHDI seems to be 6.061 and can be downloaded from here:

ftp://ftp.uni-regensburg.de/pub/freeware/software/atari/tools/disk/hd/

The filename is ahdi6061.zip

You'll probably need ahdiconf.zip too, in the same directory.

It works fine for me, maybe you have some other server problem. There is also
a plain text version of the FAQ at Hallvart's site at:

ftp://ftp.sn.no/user/hallvart/atari/info/quickfaq.txt

If that doesn't work send me an email and I'll send it to you...

Anyway, here's the section you're after:

1.2.3 VGA, SVGA or multisync monitors

First of all, you need a monitor that supports the following refresh rates :

ST High ST Low/Medium
Vertical refresh rate 72 Hz 50 or 60 Hz
Horizontal refresh rate 31.5 Khz 15.75 Khz

You will then need to build a simple adaptor that converts the RGB signal from
the ST monitor connector to the monitor's connector. The proprietary connector
used on the Atari will probably be difficult to find though.

A FAQ on the use of multisync monitors with the ST can be found here:

ftp://ftp.teleport.com/users/atari/multsync.faq

I'm not real sure about this (I don't have a Mega STe) but if you have an
internal host adaptor (Atari's), doesn't it have to be disabled, and your
SCSI Id's all set? Hope this helps...

: (mine's on my re-boxed falcon).

I got mine used. It was previously used on an older ST, and I had to redo the connections. After that, it worked perfectly. I spent an hour doing it, just to be sure I was doing it right. Worth it to take the time.

Now to attach my power cables to the ST, which allows me to use an external power supply, rather than the internal one. A 165W supply should run a gig drive, a host adaptor, and a 4 meg STE quite well...

What's the SCSI ID of the drive, Tim? If the drive inside the MSTe
has the same ID, then it's not going to work. Try chainging either
the jumper on the external drive, or the ID select switch on the
MSTe's internal host adapter.

The ST scans at 15.75 kHz horizontal and either 50 or 60 Hz vertical
(depending on the video mode - PAL or NTSC) in Low and Medium rez.
High rez is equivalent to VGA monochrome, so you can use a plain VGA
(or SVGA) monitor for ST high-rez. Instructions for building an
adapter (and a list of older multisync monitors that WILL do ST-low
and ST-medium) is at ftp://ftp.teleport.com/users/atari/multsync.faq

There are a few games that run in high-rez, too (I recall "Bolo" for
example), and there are colour emulators for use with high-rez.

More important, there are still Atari software dealers - in all
fairness, people, PLEASE try to buy a copy before you stoop to
stealing them. These vendors are trying to make an honest living, and
in most cases, the prices are tiny (usually about 10 percent of the
original retail price) and you gety not only the pelasure of the game
itself, but the warm fuzzy feeling of knowing you helped an Atari
dealer stay in business another day.

Yes. The black (ground) leads go in the center, if you have a split
plug).

>The ports I recognize on the left side are:
>
>Keyboard connector (uses a mega-style keyboard - can I substitute my spare
>PC keyboard somehow?)

Not easily. However, you can jury-rig a regular ST keyboard - it
won't be pretty, but it should be possible. Just reverse-engineer the
instructions for connecting a Mega keyboard to a plain ST/Falcon.

>?? A small female port. No idea on this one.

Appletalk LAN port (RS-422 - balanced RS-232, basically).

>Two RCA style connectors - I'm assuming audio-out plugs?

Yep. Stereo.

>Joystick 0 + 1

Nope. Those are serial ports. The joystick ports still come from the
keyboard. There's a third serial port on the motherboard - it
connects using a PC-standard 9- or 25-pin male plug with a ribbon
cable and 10-pin female header.

>ACSI port (will my ICD Host adaptor work? I hope so!)

Yes.

>Above the parallel & ACSI: Serial 2. I'm guessing this is the "enhanced"
>serial port I've heard about. What happened to the normal serial port? I
>don't see another one..

Ah. Mentioned above. Use Modem2 for most modems.

>Looks like an RF output port similar to the one on my 1040FM??

Yes.

>As well, there are a few unfamiliar sockets on the board itself:
>
>Empty, labelled "spare1" and "spare2" to the right of the SIMMS (assuming facing
>from the front)??

That's what they are - spares. Unused in the final design.

>I've read that only DIP switch 7 does anything?

I seem to recall that one fo the others disables DMA sound but I see
no point in that.

>Another empty socket: U405 about 2 inches behind the SIMMS?
>
>I guess the empty square socket by the 68K is for a 68881?

Yepper.

>I'm assuming the port at the top right side is for the internal floppy?

Also correct.

>Also, I thought this was supposed to have a VME bus slot? Where is that?

Should be attached via a dual ribbon cable near the center of the
board. Not real useful, considering the cost of VME card devices.

>Any other important things to be aware of with this machine? New video
>modes (I know it has 4096 colours). I know about the better sound - is there
>a list of what's changed somehwere?

No new video modes, but the sound will be better with any program that
can handle the DMA sound system.

>I would prefer email, but I'll read this group as best as I can.

Other options (unfortunately pricey, but can be used with other
computers also):

a) There are Amiga monitors available that have built-in stereo amps
with speakers, and which will work in all ST rezzes.

b) Princeton (I think) recently introduced a combination NTSC video
monitor/SVGA monitor. If it can handle NTSC video, there's a 99
percent chance it can handle ST low- and medium-rez RGB signals.

But what for? the mega STe have a SCSI port, haven't he???

Perhaps I'm wrong...

1725. 1040ST power supply

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-29 00:00:00 UTC
From: mbergman@orednet.org
Message-ID: <5mijfa$88t@ednet2.orednet.org>
Source record: 16860

I've recently acquired an Atari 1040ST computer system which
appears to have a dead power supply. A couple of the circuit
traces have melted and no power past the first transformer.

The model number of the power supply is: APS34-1

I scoured the Internet for two weeks trying to find any info
which might lead to the repair or replacement of this power
supply, to no avail. However, I'm sure I did not find all the
nooks and crannies of info regarding the Atari 1040ST.

I'd appreciate a scanned image of the circuit diagram in GIF
format, attached to an email and any related text info, or the
name and info of anyone who might have a replacement for this
power supply; a used unit is ok too. I'm looking for a mouse,
as well.

My plans for this machine:
1. First, get it operational using its native programs.
2. Experiment running it under Minix or Linux OS.

Any info would be greatly appreciated... thanks for your time.

1726. ZIP & MegaST

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-29 00:00:00 UTC
From: allmidd@xs4all.nl
Message-ID: <5mk8fc$p3i$1@news2.xs4all.nl>
Source record: 16861

Somebody asked me to let him know if I solved the problem connecting
a ZIP drive to my MegaST. Sorry, I lost the addres.
My configuration was:

MegaST (with 16Mhz acc)
ICD LINK II
Quantum Lightning 540S
ZIP drive.

Although this worked fine without the ZIP-drive, it did not after I
installed the ZIP.
Symptoms: data transfer from the Quantum was corrupted (visible in
FAT display etc.)
My dealer suggested replacing the LINK II by a LINK96 could solve the
problem. Not because the LINK II is no good but because some MegaST's
seem to have a not-to-good DMA chip. I heard of this problem before.
Some soldering seems to remedy this, but this is beyond my skills.
The LINK96 should not be that sensitive to the DMA problem.
Indeed, replacing the LINK II by the LINK96 gives a fully stable
system. I even chained another SCSI drive behind the the ZIP and it
works fine.

Johan

BTW, I now use Uwe Seimet's HDDRIVER 6.22. Certainly can recommend
that!

1727. How To Upgrade MSTE to 1.44meg Floppy

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-29 00:00:00 UTC
From: jperez@Hawaii.Edu
Message-ID: <5mkmlj$g8b@news.Hawaii.Edu>

Greetings,

A friend of mine accidentally purchases an Atari Mega STE with
only a 720k floppy. I was wondering whether it is possible to upgrade
this to 1.44meg. Will an AJAX chip and TOS upgrade be necessary?

Seeing as how Atari has gone out of business I can fully understand the dilema your faced with. If you can find out the voltage inputs into the motherboard, you might be able to take a standard PC AT powersupply and fabricate a makeshift atari power supply IF it uses similar voltages as do PC AT motherboards. (ie. 5V input with common ground)

1729. Artec A6000c flatbed scanner on F030?

Newsgroup: comp.sys.atari.st.tech
Date: 1997-05-29 00:00:00 UTC
From: Karl Samyn <saka@stud.rma.ac.be>
Message-ID: <338E42DF.136BE204@stud.rma.ac.be>

hello,

Well, the subject line says it all. Is it possible to connect an Artec A6000c flatbed scanner to my F030, and use it in several programs. The scanner has a scsi connector, so connecting it to my F030 won't be a problem, but are there drivers for this type of scanner, or doesn't this matter?
